3961. AT-1000 Issues

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-01-02 06:07:31 UTC
From: kc2ftn
Topic: 3961 Message: 3961

Equipment: LDG AT-1000 Autotuner
with v2.5 chip upgrade.

Symptoms: Unit de-tunes during transmit.

To use the tuner, I'll switch the exciter to A.M. and transmit
about 30 watts into the tuner as it's connected to my HF vertical
antenna. I'll then press, hold, and release the "Tune" button initiating a
Full-Tune cycle, which seems to work fine. After a good SWR
match is obtained, I'll simultaniously press the Cap and Ind 'Up'
buttons to store the SWR setting into memory. I'll then switch the
exciter back into the SSB mode and increase it's output to approx.
65 or so watts PEP, which is enought to drive my external amplifier
to about 700 watts output. Then while transmitting, the relays in the tuner
will start to "chatter" and the power output from the amp will slowly fade
down to about 300 or so watts. Also, in order to get the tuner to go into
the "Bypass" mode, I not only have to turn the tuner's power button to "OFF',
but I also have to shut it's power supply off too. Any suggestions?

3962. Re: AT-1000 Issues

Sounds like RF getting into the tuner, the DC line, or the ground.

Standard grounding and RFI procedures would be the first step. Chokes, grounds, isolators and that sort of thing.

3963. New to the group & have a n AT-897Plus question

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-01-03 03:18:51 UTC
From: air2dgb
Topic: 3963 Message: 3963

As a new member I would like to thank you in advance. I am also a new owner of a Yaesu FT-897d and an AT-897Plus. After following the instructions and operations my tuner doesn't appear to tune and the LED flashes continuously. I have not found anything in the manual or this groups messages about this condition. Has anyone experienced this or can offer suggestions?

From: Howard Z
Topic: 3961 Message: 3964

Hi,

It has been my experience that with most antennas, tuning with an SWR at 10 watts for a perfect SWR does not guarantee a perfect SWR at higher wattage.

One can have a perfect SWR at 10 watts, put your tuner (any model/manufacturer) into manual mode so nothing with change, and then raise the power and find the SWR has now become worse.

In your case, at 65 watts the SWR is now above the SWR threshold of the auto tuner, so it is tuning again.

Unless the LDG AT-1000 owner's manual prohibits it, I suggest you tune at the power level you plan to use - up to 100 watts.

Howard

Patrick,

LDG does not have a pre-made cable for extracting DC from Yaesu radios. However, using a mini-Din 8 connector and the pin diagrams of the CAT port in the Yaesu manual, you could easily make your own.

Be very careful doing this. There is a small surface mount fuse that can blow if you short the DC to ground. It is somewhat difficult to replace because of the size.

3968. Software version

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-01-05 21:30:57 UTC
From: Barry
Topic: 3968 Message: 3968

I recently purchased an AT-1000Pro (holiday gift to myself) and the software version is 1.3. Is this the most recent version of the software? It is my understanding that upgrades are purchased by end users as a chip to be installed. If this is not the most recent version when was it the most recent version, what is the most recent version and is it imperative to make the upgrade?

Thanks. Barry N2MAD

Hello Barry,

I am sure your software version is probably up to date. My PRO is version 1.1. I am curious what was improved since then. I wonder if I should update my chip.

Anybody remember when the only way to upgrade a piece of hardware was to buy the complete new product?

Hi Barry,

The latest AT-1000Pro code is V1.3. We have not had an update in a couple years. Most of our improvements are to the tuning algorithm to reduce tuning time and find better matches.

3973. AT-897 woes

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-01-06 20:59:36 UTC
From: worsr
Topic: 3973 Message: 3973

I've had this tuner for a few years now, but it has started not working. I've tried it with the W4RT cable and also another CAT cable. It seems pressing the tune button does nothing, doesn't light up or anything. I've got menu 20 set to CAT and menu 19 set to 9600. I know the CAT jack on the radio is OK as it works properly with the computer.

Is there anything I can check before sending it off to LDG??

thanks,

Mike, W0RSR

Hi Rick,

It's not a recommended upgrade as you may not even see any difference in your tuning.

However, you can always e-mail LDG directly for a chip or part that is not carried by www.cheapham.com or www.w4rt.com.

Date: 2010-01-07 00:10:28 UTC
From: Dwayne
Topic: 3973 Message: 3975

Mike,

The AT-897 does not use any menu settings on the radio. If the tuner is not even lighting up when you press and hold the Tune button on the tuner, then it could be the tuner is broke, the CAT cable is broke or the radio is not providing 12 VDC on the CAT port.

A technician should be able to check if there is 12 volts on the CAT port and on the CAT cable. If both og those are working properly, then it's probably the tuner.

Thanks for your prompt response Dwayne. I have a follow-up question: The tuner came with multiple connectors, one of which is a cable with a molex connector on one end split into two on the other. Is the purpose of that cable to control the tuner as well as supply power to it? If I use that to power the tuner do I plug in the other split cable end into the tuner to control it? Is that the purpose of the connector?
Thanks for everyone's prompt responses.

From: Gary Mackey
Topic: 3981 Message: 3981

Hi All,

I've got an AT-200Pro and use it on my Flex3000 instead of the internal tuner and love it. I run an amp SB-200 once in awhile and considering an upgrade to the LDG AT-1000Pro to eliminate the need for my manual tuner when I decided to run a little power. I've got two questions. 1) Are there any plans on changing the cross-needle meter on the 1000Pro over to the LED meter like my AT-200Pro uses? 2) Can I assume if my AT-200Pro tunes my antenna fine at 100w in auto mode. I can expect the same from the AT-1000Pro at 500-600w in auto mode ?

Thanks

73,
K8EHB

Barry,

That cable is the IC-PAC for Icom Power and Control. The molex connector will match up to any Icom radio that is AH-3 or AH-4 compatible.

Thank you for your prompt response Dwayne. I'm running a 756P3 so I'm going to set up up that way today. Great product.

I have a follow-up question: The tuner came with multiple connectors, one of which is a cable with a molex connector on one end split into two on the other. Is the purpose of that cable to control the tuner as well as supply power to it? If I use that to power the tuner do I plug in the other split cable end into the tuner to control it? Is that the purpose of the connector?

Gary,

We typically don't publish any of our change plans, but I can tell you that we are not changing the meter to a bargraph.

All of our tuners will tune approximately the same range, but not exactly the same. Sorry that I can't provide you with a yes or no answer.

Topic: 3968 Message: 3985

The only problem with my LDG AT-200 Pro, is that the cable to my Yaesu FT-857D won't stay in on the tuner end (Seems the jack is either loose, or was incorrectly installed.).

Would that cause errant high SWR readings, as the tuner suddenly stopped tuning an existing antenna that I had no previous problems with & testing with a NEW coax & SWR meter reported a flat SWR in my mobile installation, where the tuner had been reporting higher than 3 to 1 SWR regardless of coax..

It wouldn't even tune a dummy load several months ago, meanwhile having no problems with the tuner removed & getting better SWR than with the tuner (Per use of a Heathkit SWR bridge).

Howard,

The jack may have broke if the connector will not stay in.

The jack is just the control for keying the radio and would not have much to do with the actually tuning ability. Obviously if the radio stopped keying in the middle of a tune, it's not going to find a match.

Sounds like it need s trip back to LDG for a check out.

Good evening to all

I have a Z11Pro, which is built to tune up to the 6m band.
Are there reports of successful tunes on the 2m band ? I am at 850 km of my shack, and I have no antenna for 2m...

The tuner is already boxed up along with some print out's of
correspondence from LDC over a related matter..

Meanwhile am running straight from the radio to antenna with no high
SWR indication on the Yaesu FT 857D control display..

Now to find a Xerox to copy the sales ticket, then to UPS for shipping..

Hello and I am sorry to use our list to ask this,

But yesterday I went wild and made a swap: my FT-100D and a Z11-Pro to a TS-480SAT!

But I am looking again for a Z11-Pro. I am "in love" for this tuner, but since my TS-480 has an internal tuner, I don't think I need to buy a new one...

So if you have a Z11-Pro, 9/10 in looks and functions, please write me a line...

I live in Lisbon, Portugal, so please be kind to consider this when calculating a price.

Wishing you all the best,

Date: 2010-01-15 11:58:09 UTC
From: iona350
Topic: 3994 Message: 3994

My wife and I are living in Cairo, Egypt. She will shortly be licensed here in Egypt so I brought along a new Icom 718 and the LDG-7000 from my Icom-7000. Icom 7000 is not allowed in Egypt because it has VHF and UHF capibility. No 6 meter, VHF or UHF allowed. I should have tested them together at home in Michigan before we left. Alas...I did not.

I cannot get them to work together...even though page 7 of the LDG tuner says it will work with the 718. LDG manual says to select the AH-4 setting when using the Icom 718.

In the 718 manual (page 28) it says "Never select the "4" (AH-4 automatic antenna tuner), otherwise the transciever transmits automatically when turning the power ON." Push (tuner) to cancel unexpected transmission. Then re-select tuner type correctly.

Does this mean I should turn on the 718 with NO tuner selected, then select the AH-4 after power is on?

I don't want to have a problem. In Egypt there are NO stores that sell radio equipment or supplies such as coax, pl-259's and other supplies we take for granted.

Anyone have experience with this problem?

Jack,

Page 28 is for settings for the AT-180 antenna tuner. You need to refer to page 29 only, which refers to the AH-4, for which the LDG tuners are configured. Set the tuner option to 4 and connect the LDG tuner as LDG suggests and you should be OK.

3996. True Balanced Auto-Tuner?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-01-18 02:35:07 UTC
From: ab9ta
Topic: 3996 Message: 3996

Hello, I've been looking into using a ladder-line fed doublet on 160M, the only trouble is that it will have to be installed at under 25' above ground. This means that the impedance of this antenna is going to be fairly low on 160M, in the low single digits according to EZNEC. And, I want to be able to use this same antenna for 80, 40, and 30M too.

I like the convenience of my AT-100 tuner, but I can't seem to find a specific balanced auto tuner out there..
There is always the output balun option, but I've read that in situations where the SWR is really high on the feed line, the output balun can actually cause problems..

After putting a little thought into this, I started wondering if it is possible to put a 1:1 balun at the input of the tuner (between the radio and tuner)and then float the tuner with no ground connection. (The tuner could be powered by a battery so no power supply connection is required)

Alternately, I considered using two AT-100's, after the balun, each tuning one side of the ladder line.. Sounds strange at first, but it occurs to me that the combination of inductance & capacitance wouldn't be too different than some of the tuners designed strictly for balanced applications..
I don't know how well the two tuners would cooperate, but I just wonder if something like this has been tried before..

Thanks,
Bill AB9TA

Hello Bill AB9TA

I would recommend you to use a 1:1 choke balun.

Using a FT 240-61 toroid and making 14 turns of "figure 8 cable" or thin 50 ohm coax you will get good results :)

I have attached a photo of one commercial version that uses copper wire.

Toroid source:
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=380188871575

I also attached an article by Mr Paul M0PNN [see page 10] and he talks about this balun.

I wish I could help more... Just telling you that I use this balun with success in a QRP doublet antenna, made with computer cable:
http://www.norcalqrp.org/norcaldoublet.htm

Bill,

The only Balanced Auto Tuner that I know of is from Palstar BT1500A which is MANUAL and is priced at a whopping $695

A balanced tuner is supposed to be the best for wire antennas. Perhaps LDG or Palstar might be interested in making an AUTO tuner that is balanced?

Once I tried running ladderline into my home and got oodles of stray RF mucking up my computer and usb devices. So, I convert the ladderline to Coax outside the house. I don't know how to avoid ladderline in the home from radiating. So, personally, I wouldn't be interested in a balanced auto-tuner at this time.

Hi Howard and Bill,

We have the same issues with ladderline trying to keep RF out of the shack. The added cost of a Balanced tuner is significantly higher than just adding a balun. The performance differences are not that great, so most people just go the balun route.

We did a survey a bunch of years ago and couldn't find enough people that were interested (to pay that much more).

Subject: [LDG-auto-tuners] True Balanced Auto-Tuner?

Hello, I've been looking into using a ladder-line fed doublet on 160M, the only trouble is that it will have to be installed at under 25' above ground. This means that the impedance of this antenna is going to be fairly low on 160M, in the low single digits according to EZNEC. And, I want to be able to use this same antenna for 80, 40, and 30M too.

Check out the SGC tuners. They are made to feed long wire and balanced line.

Dale

I second the difficulty. I lost a D-104 mike to stray RF in the shack with a resonant antenna fed with ladderline. It was attached to a second station (S-line) in the shack that wasn't connected to anything except ground. The ground connection was less than 8' and in salt impregnated soil. I put up a coax fed dipole after that. I was tuning up and caught motion from the corner of my eye. The D-104 was releasing its smoke. Was my best mike element too.

Jim.

Hi Dale,

The SGC tuners just float the ground for feeding balanced line. They are not True Balanced Autotuners that we've been discussing.

The antenna sounds interesting. Let us know how it works out.

Dwayne, I will let the group know what happens.. Will try the antenna this summer at the new house..

By the way, has anyone tried using two autotuners on a balanced line, one on each conductor of the ladder line? They would tune each side of the ladder line against ground.

Balanced To
Line Antenna
----- 50 ohm coax ----- 1:1 Balun ---------- AT-100 #1 --------
---------- AT-100 #2 --------

I know that looks crazy, but I've seen schematics of true balanced tuners that use two mechanically coupled roller inductors each in series on each leg of the balanced line with capacitors across the balanced line.
I'm wondering if two autotuners would tune in this manner..
I think that the AT tuners use series inductors, so using two in this manner would be close. I just don't know if this would confuse the tuning logic in the tuners..

By the way, what was the estimated price of a true balanced autotuner?

I too have wondered if this was possible - or, even taken a step further, with a some sort of "synchronize link" connection between both tuners to permit them to communicate to one another during the tuning process.

Bill:

Trying to use two antenna tuners together would be problematic. They would have to be directly coupled to work in tandem since the solution on one side will directly affect the solution on the other side. This would be the equivalent of the mechanically coupled roller inductors or capacitors in a "balanced" tuner.

Keep in mind that most antennas (virtually all Ham antennas) are "differential" fed. In other words, the feed point consists of two connections that are fed 180 degrees out of phase of each other. Those two connections can either be two sides of a dipole, a vertical element and a ground plane, a short whip and your radio and body (manpack configuration), or whatever. Regardless of the configuration, the solution the tuner must come up with corrects the complex impedance presented by feeding those two connections to the impedance of the feed line. It is therefore one solution, not a solution for each leg.

There's also no difference in that solution between a "balanced" tuner and a supposedly "single-ended" tuner. While they may have different configurations of components, they achieve the exact same thing. The only real difference might be that a "single-ended" tuner might have a difference in relation to ground or surrounding conductors on one side of the connection to the antenna vs the other. If you isolate the "ground" side of the tuner, so it doesn't have that different relation, then the tuner becomes a true "balanced" tuner. The way to do this is to "choke" RF from flowing from the tuner "ground" connection back to the coax shield or control or power connections. That can be as simple as ferrite chokes or coiled cables.

So, if you have a "single-ended" or "unbalanced" tuner, and you need to feed a balanced antenna, you may either user a transformer (balun) on the output or you can isolated the tuner ground from the cable feeding it and any mounting it's attached to. The effect is the same as replacing it with a "balanced" tuner for all practical purposes.

Just don't touch the tuner case while transmitting! ;-)

Steve,

I'm pretty sure this is possible. There was a guy in Europe about 7 or 8 years ago that got a few of our units and tied the tuning section in one unit to another. This allowed one control section to run two tuning sections. I think he had a balun in there someplace too.

Obviously, this cost more than twice as much, so it was not really cost effective to reproduce.

The cost of a true balanced autotuner is essentially double that of a single ended unit. The inductive elements are doubled, and the switching is doubled. There are some economies such as only one cpu, but the very low volume of manufacture increases the cost more than any savings. I did find a couple on the market a few years ago but they were in the vicinity of 1k$.

Synchronizing two single ended tuners would not likely work unless the manufacturer did it as the tuning steps would have to be carefully timed.

Using a tuner and an effective balun is, as has been pointed out, essentially similar. The key here is "Effective Balun". Depending on the situation the requirements for balun effectiveness can be technically quite difficult to meet. Most baluns have fairly meager capability to force balance.

That being said, if you get a really good balun and it will work for many antenna configurations. The most effective baluns don't use beads and have more than one core. Good ferrite is not cheap, and lots is required, so expect to spend a bit on a really effective balun. The one I use has several pounds of ferrite and 30 something cores in it, with the teflon coax passing through each core three times giving about 100 cores equivalent impedance. I put it on the wall outside the shack and feed it with a few feet of heavy coax to the tuner just inside the wall. The losses in this section of coax can be important so make it very short and low loss. As long as the antenna is reasonable this works quite well. Balanced line is used from the tuner to the antenna outside. I run 500 watts at times and have had no RF problems in the shack with this setup.

In some cases a balun is not required to encourage balance in which case anything works. In other cases a significant choking impedance is needed and then only a really effective balun will solve the problem. Changing frequency on a multiband antenna changes the situation so that on some frequencies there is no problem while on others the balun is insufficient to prevent imbalance. Changes to the antenna system can also help by reducing the balun requirements.

If there is RF in the shack, or the autotuner is going crazy of you are hearing RFI from the house, the reason is most likely the balun is not effective enough for the situation. Improve the balun and/or the antenna/counterpoise to fix it.

I see Dwayne has also just now replied to this thread, the above was done prior to his response.

73,

Alan:

You might clarify a bit. You seem to be concerned about loss in the coax
that makes up the balun. That's a bit of an oxymoron in that coax is
typically not used in a balun that would go on the output of the tuner,
but at the input of the tuner the SWR is very low, so the amount of coax
in a "balun" used to isolate the tuner from the rest transmission line
does not represent any significant loss.

I would agree that the best approach is to isolate the tuner from the
transmission line and control cable since using a balun on the antenna
side of the tuner presents possible losses and may not fully balance the
feed or remove common-mode current. I don't think achieving good
isolation is all that difficult though.

I don't want this to develop into a major discussion thread here.

The case I presented places the balun on the antenna side of the tuner. This is not ideal but it is often the most practical situation. It works quite well if the impedances are not too high. If they are really high then there are problems with most solutions...

Placing the balun in front of the tuner solves some problems and causes a host of others. In addition, all other leads to the tuner must be isolated, and the case floated. There are many paths that can bypass the effectiveness of the balun there. It is similar to bringing the balanced line into the shack. Not very practical.

Roy Lewallen's paper showed by mathematical analysis and measurement that placing the balun on the 50 ohm side of an unbalanced tuner does not lessen the requirements for choking impedance to effect balance (since the one side of the tuner is shorted to the balun through the tuner's ground). In a tuner system the choking impedance of the balun must exceed the tuner's output impedance by a large factor (approximately 5x or more) and this can be thousands of ohms, a value most baluns cannot come close to achieveing. A balun that does not have this required choking impedance will not be "effective", and balance will not occur - the RF current will divide per the impedance ratio and flow onto the outside of the shield as well as the antenna. The resulting RF current will flow on the coax shield to the equipment cabinets and eventually on to the ground system. Ground systems inside the shack are never low enough impedance at RF to totally eliminate the potential caused from these currents thus there will be RF voltage on everything in the shack. The amount of this RF voltage will be directly related to the effective choking impedance of the balun and the impedance of the antenna and feedline system (as well as the impedance of the ground system).

So keep the impedance at the output of the tuner from getting too high by antenna and feedline system design, and use a highly effective balun to maintain adequate balance. The more effective the balun, the higher impedance it can handle and still maintain adequate balance. The more power you run the more effective it needs to be because the RF currents are larger and greater impedance is required to keep the leakage currents low enough to maintain adequate balance and minimize the RF conducted onto the equipment.

That's my advice. I hope this hasn't been too technical, and again, I don't want to engage in a major discussion of this here. Many folks have different ideas about how things work. There is a great deal of material published on this subject, and not all of it is correct.

I'm not as pessimistic as you are in this regard and I think the
experience people have choking the transmission and control lines to
achieve isolation supports taking that approach.

Yes, all other leads do need to be "decoupled". This is usually just one
control/power cable and all you have to do is to run that through the
same choke or coiling used for the transmission line. In fact, it's
probably preferential to do it that way. What would be the other host of
problems?
> Roy Lewallen's paper showed by mathematical analysis and measurement that
> placing the balun on the 50 ohm side of an unbalanced tuner does not lessen

> of the tuner is shorted to the balun through the tuner's ground).
Sorry, but I don't follow this. The point is to implement an impedance
on the cables feeding the tuner high enough to adequately choke
common-mode currents. I don't know how the "short" you refer to applies
in this case. In this case, the balun is simply a choke and it doesn't
matter that the ground of the tuner happens to be electrically connected
to the coax shield--all cabling will be "decoupled". It may be best to
not think of this as a "balun" but rather a simple RF choke.
> In a tuner system the choking impedance of the balun must exceed the tuner's output
> impedance by a large factor (approximately 5x or more) and this can be
> thousands of ohms, a value most baluns cannot come close to achieveing.
I'm also not sure this is the case. The impedance presented across the
output connection of the tuner is not necessarily related to the
common-mode impedance of the antenna system and tuner case as a whole
presented at the choke. In fact, I would think they would normally be
quite different. Keep in mind also that the effectiveness of the choke
is also dependent on the impedance presented by the cable bundle coming
to it from the other direction, which is something you can control.

Overall, I do think the experience of these types of installations do
show this to be a valid approach, but admittedly there can be situations
that can foul you up. That's almost always the case and that's why a
rational approach to keeping RF out of your station is always a good thing.

Apologies for all this traffic. I hope this is educational and useful.

The advice I gave is technically sound. Roy's article was published in QST and one of the Antenna Compendiums from ARRL as I recall. For those who don't know, Roy Lewallen is the author of EZNEC.

An example with some simplification:

Assume we have an "ok" balun. It presents 300 ohms choking impedance which is six times the 50 ohm cable and would be fine for most 50 ohm applications.

The current emerging from the output of the tuner on the shield side has two paths it can follow. One is into the antenna feedline, the other is across the tuner case and across the balun to the station chassis and ground. The current must divide following the inverse ratio of impedances.

So the balun's choking impedance is directly opposing the tuner's output impedance, splitting the antenna current at that point. If the choking impedance of the balun is 300 ohms and the antenna's impedance at that point in the feedline (note this includes reactance) is also 300 ohms (well within the tuner's range) then the current will divide equally into the antenna feedline and into the balun. Half the antenna current will flow into the balun via the shield and onto the equipment cabinets and into the station ground. Bead baluns often overheat and exceed the temperature rating of ferrite (which is quite high) and crack apart in applications such as this. Significant amounts of power can be expended in the balun (and the station ground). Lots of people do this all the time and never realize it unless the balun smokes or the RF interferes with the computer or burns them on the lip (hot microphone).

It is clear from this example that a balun with higher than usual choking reactance is needed when used with a tuner. Alternately the impedance of the antenna can be kept low and then a "normal" balun will suffice. If the antenna has a high impedance it is very difficult to get an adequate choking impedance.

Some makers of high quality baluns recognize this fact and make special "tuner application" baluns that have much higher than usual choking impedance. This is what I use.

Note that using a balanced tuner solves this problem as the short across the tuner case is gone and the balun does not see the antenna's impedance. The coils on both sides of the current path protect the balun and the station ground from the antenna current and improve the balance. People who have built these balanced tuners often report not only no RF in the shack, but much less receiver noise picked up from the house - this same path works in

reverse to allow noise from the house into the receiver.

Much of the time using a regular balun things "work out" and there is no problem. Other times it doesn't and folks are confused as to why they have RF problems. It is all a matter of degree. Current divides by the inverse ratio of impedances. The choking impedance needs to be high enough. Unbalanced tuners put much higher stress on the balun requirements.

The original poster was correct, the best answer is a balanced tuner. However in most cases a reasonable solution can be found with an unbalanced tuner and an effective balun. Depending on the circumstances a more capable than usual balun is called for. Since we operate on a wide range of frequencies it is prudent to use the high performance balun from the start, otherwise there are likely some frequency combinations that will be troublesome with increased RF in the shack, wasted transmitter power and increased noise in the receiver. How often do you hear someone say "this antenna works great on all bands except on x meters where it (resets the computer, gets into the landline, etc)".

Someday perhaps some manufacturer will take the lead and make a cost effective balanced auto tuner. If properly designed and made in quantity the cost increase can be considerably less than double. Twice as many coils are required, but they are only half the inductance (each). The relays can be chosen with contacts to switch both coils at once. The result of this tuner design will be far fewer customer problems. Problems with RF in the tuner, RF in the shack, etc will be dramatically reduced or eliminated. This balanced tuner would provide increased current balance not just for balanced antennas, but also for unbalanced antennas. After all, RF in the shack is the same problem regardless of the antenna's balance or lack thereof. It is current balance in the transmission line that determines this, not balance in the antenna itself.

The customer doesn't know he needs a balanced tuner, so asking them doesn't work. The folks who have problems with RF don't know why they have them. They don't have a balanced tuner to try out so they don't know if it would solve their problems. They may try a better balun, but most don't even know to try that.

All excellent information, thanks to all...

The reason I thought of using the two tuners is that the path for the antenna current is independent of the cases of the tuners.. Also, as one earlier post points out, a 50 ohm 1:1 balun on the input would be operating well within its' design tolerances for isolation, and it gives us the two leads to the tuners 180 degrees out of phase.

Also, someone noted that the tuner is providing a total solution for the antenna / feedline problem. So, I wonder if there is a difference between the two tuners' solutions, would it be a large difference, and would it cause that much of a problem..

I do like the idea of pulling the tuner relay coil leads out to control external relays, i.e., one control lead controls two relays, one on each half of the balanced tuner..

More to think about...
Thanks, Bill AB9TA

Alan:

My last post because I can see where this is going. Making a statement in an article in QST or any publication, or for that matter a manufacturer's documentation, does not make it correct, and nobody should be afraid to reconsider those writings in light of additional information.

The tuner is looking at the differential feed to the antenna and matches that impedance. The effective impedance at the choke is likely to be completely different. Take for example an off-center fed antenna. If you feed it at a frequency where the side connected to the tuner case is about 1/4 wavelength, and the length from the choke through the tuner chassis to that side of the antenna is short, then you'd be seeing a low impedance at the choke. The other side of the antenna may however be closer to 1/2 wavelength, and the tuner needs to match that. In this case, it's irrelevant what the differential feed impedance is since clearly the choke is working against a low impedance.

Another consideration is that tuner is applying reactance to the antenna impedance to match it to 50 Ohms. If you look at the simple case of a vertical and a ground field, and correct the impedance of the whip with reactive components, what is the impedance looking into the input of that network against ground? 50 Ohms! Consider also a balanced dipole that has reactive components on both sides at the feed point (which is the same as a balanced tuner), what would be the impedance seen across the choke? So, it could be argued that the tuner is actually correcting the impedance presented by the antenna elements to make it appear as 50 Ohms at the input of the tuner, isn't it? If the tuner has applied a correct solution aren't you always looking at some relatively low impedance at the choke? 300 Ohms then becomes significant. This is why this works in practice.

I would also add that the effect of the choke is similarly dependent on the impedance presented by the line headed toward the shack. That's something you can better control and should, and should also route lines to minimize coupling with the near field of the antenna.

Perhaps we could come up with situations where the antenna feed impedance would be similar to that at the choke. However, the math will only work for you if you're applying the calculations properly. In this case, the assumption of the calculations was that the choke on the input to the tuner is working against the feed impedance of the antenna without regard for the tuner or any particular characteristic of the antenna, which is clearly not so. As such, those calculations need to be corrected if they are going to properly represent the situation.

I do use EZNEC quite a bit and appreciate the work and knowledge that
went into it. It is, however, always the case that your answers depend
on the nature of the problem. Are you sure that Roy was explaining this
kind of situation--perhaps not.

Not all articles are correct, but this one is technically above the usual level and has been reviewed by others. I did some looking and did not find the version of the article that I remember, but I did find a another version of this discussion on Roy's EZNEC website here:

http://eznec.com/misc/ibalun.txt

This article analyzes placement of the balun with respect to the tuner, among other things. It shows that moving the balun does not improve balance. The only determining factors are the choking impedance of the balun and the common mode impedance of the leg of the feedline connected to the tuner.

Here is another analysis by Tom Rauch that uses spice verified by measurements to show the balun location does not matter:

http://www.w8ji.com/tuner_baluns.htm

And another by Kevin Schmidt on putting a Balun and a Tuner together:

http://fermi.la.asu.edu/w9cf/articles/balun/balun.html

Placing the balun in front of the tuner also lifts the tuner chassis to a potentially high RF voltage and introduces additional capacitive coupling to nearby equipment (which can be significant on higher frequencies), as well as placing RF onto other cables connecting to the tuner. RF decoupling these cables is potentially more problematic than the original issue as RF on the control and power lines even at lower levels can cause problems. It also means the chassis cannot be grounded per usual station design and code requirements.

I see what the problem is here. Looking at only differential impedance (between the feedline conductors) is not sufficient. I was referring to common mode impedances (feedline conductors to ground). Those are the ones that affect the balun's ability to prevent unwanted ground currents. If the differential impedance of the antenna feedline is low then most of the current will flow differentially. However since we are using a tuner it is likely (at some frequencies) that the differential impedance is high. The current will divide per the impedances that it sees which are the antenna feedline differential and common mode impedances, and the balun common mode impedance. If both the differential and the common mode impedance of the feedline are high then the balun's common mode impedance will determine the unwanted ground current flow. Note that the lowest impedance will get more of the current. Having a high differential impedance causes the stresses on the balun and the ground current. If the antenna and feedline present a low impedance to the tuner the stress on the balun

is low.

I encourage folks interested in this subject area to look up the article. It shows mathematically that there is no difference between placing the balun before or after a single ended tuner (with respect to balance). The balun sees the uncorrected impedance of the antenna feedline in common mode, not benefitting from the reactance compensation or impedance conversion of the tuner which only corrects the differential mode impedance.

Since a single ended tuner is only tuning one side of the feedline, the other side being the chassis and shorted right through, It does not affect the common mode impedance of this shorted side and the balun directly competes with this impedance. It is this conductor's common mode impedance vs the balun's that governs the current splitting (lack of balance) and unwanted ground currents.

To summarize, using a balun with a single ended tuner in either the input or output side can place unusual stresses on it (depending on the antenna and feedline system and varying with frequency). Placing the balun on the input causes additional issues so it is generally best to place it on the output side. If you like having a trouble free system (over a wide range of bands and frequencies) use a really good balun (having high common mode impedance across the frequencies of interest so that it may always be effective), or use a true differential tuner. If you have a tuner and balun system that has problems (at some frequencies) you can try a much better balun or modify the antenna and/or feedline system to lower the common mode impedance the balun is competing with. Using a clamp-on RF current meter to measure RF on the station ground can show if there is a problem - there should be no RF on the station ground or on the outside of the feedline out of the transmitter or amplifier (if the antenna and feedline system is operating properly balanced).

Hope that adds some clarity for folks.

From: k4hrm
Topic: 4015 Message: 4015

I have an old Kenwood TS-430S HF Transceiver with a G5RV dipole antenna. I recently was gifted with an LDG AT-200PRO tuner. However, the TS-430S has an 8 pin DIN and the AT-200PRO a molex connector. First, will the AT-200PRO tune on the TS-430S? Second, any suggestions on where to acquire the correct cable for connecting?

4016. True Balanced Autotuner

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: Sam Barrett
Topic: 4016 Message: 4016

I kind of got in on this thread in the middle, so I am not sure what the initial question was. However, I will describe my setup for what it is worth.

I have a Z-100 that I use on my IC-735 standby rig, primarily for digital work. My two main antennas are fed with 450 ohm window line. One day I found an old Heathkit B-1 balun that I had on the shelf in my closet. Having never used it, I opened it up to find that it consists of two nice wire inductors about 6 inches long in parallel, kind of like the stuff we used to buy by the inch. The diameter is about 2 inches, and there must be about 12 turns to the inch.

By hooking the balanced line to the balun output and the 50 ohm UHF connector to the Z-100 output, I find that it tunes my wire antennas very well. I don't think I would run a lot of power, but it certainly takes full output from the Z-100.

I have seen some of the old B-1 baluns on eBay from time to time.

Hope this helps someone.

Alan:

OK, my last, last post. I have to say though that I don't fully agree with your conclusions, but respect the thought and research you have put into this. I'd have to take a weekend with the referenced documents to determine if there is a problem in the way you are translating the information in the documents, whether the documents really don't address the actual issue at hand, or whether those documents are in disagreement with my evaluation.

As to the more practical matters of doing this with a single-ended tuner, I'll leave that to the number of people, myself included, who have done this with good success. It's not that hard to isolate the tuner mounting and to bundle all cables through the "choke" and the results speak for themselves.

Good and inspiring discussion.

Chuck

I to have nothing but good to say about LDG. I have some LDG tuners I use at home, in the woods, in my truck and in my trailer, and find them the best investment in radio gear I have ever made.

Great on over the phone help, and fast turnover if you need work on the tuner.

I have not had other auto tuners, but why change when I have people that not only make a great product, but stand behind it like no others.

I have let my friends use a couple of my tuners at different times, and they to were sold on the product.

I like that Luis, LDG= Loads Darn Good.

LDG, keep up the good work.

4021. Re: Alpha testers wanted - Added s/w support for LDG AT200PC tuner

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-01-28 03:56:10 UTC
From: Howard Z
Topic: 3531 Message: 4021

Hi again,

I am moving my software to N3ZH_Software group.
It still supports the LDG AT200PC tuner.
The latest addition is support for the Expert 1KFA amplifier.

It seems to be a bit burdensome to upload new versions to several yahoo groups. So, I will be placing updated versions in this new group.

Howard

Hello group,

Wonder if anyone has been using the 200pro and 1000pro on 6 meters?
I have both tuners and love them. Getting antennas up for 6 meters and find that I have some hash on both tuners when powered up. When I power them down all is nice and quite. I am using ANT#2 ports on both tuners. I have not tryed Port 1 yet. Then hash is not to bad.. from s-0 when off to s-3, enuf I cant dig out the weak signals on cw.

I have the AT-200Pro, would rather have a gauge than flashing LED's
in my mobile setup with a Yaesu FT-857D..

A front separation panel would even make it better to see while
driving, as it takes up knee space on the passenger side of my pickup
& it's next to impossible to use while driving (Was a bear to install
due to space restrictions, which is how it ended up under the glove
box on the passenger side.).

Thanks for that Howard, mainly wondering about noise or hash using the tuners on 6 meters.

Date: 2010-02-04 18:07:54 UTC
From: CT2FZI IM58KR
Topic: 4029 Message: 4029

Hello to all,

I am considering in using a full wave loop or a doublet antenna for 80 meters and up.

I also built a 1:1 current balun in order to connect the ladder line to the AT-100Pro via coaxial cable, so only a short peace of 50 ohm coaxial cable will be used.

Should I expect some issues while tuning, or it will be fair and easy?

Luis, CT2FZI

Hello Luis,

I run about 10 meters of RG58 coax from my Z11Pro tuner to a balun that is connected to 300 ohm twin lead. I have tried both the LDG 1:1 & 4:1 baluns and both setups have worked well for me.

When the WX here in Canada gets warmer I plan to do more experimenting with the baluns to see if I can find which one preforms the best.

Thank you very much for your answer.

In fact I do have the LDG 1:1 balun, I don't know if it is a current or voltage balun.

I am planing to use a 1:1 current/choke balun since it gets better results... It uses a very simple construction: 8 figure wire, 14 turns in a FT240-61 toroid.

I guess it will perform great with my at-100pro ehe :)

And I also would like to be on this side on your experiments ;)

Topic: 4034 Message: 4034

Is there any way to lengthen the control cable..?

The length of the supplied control cable is not adequate to make it between where I have my tuner & the radio in my mobile installation that has the Yaesu FT-857D under the dash on the driver side (as far to the right as possible without becoming a knuckle knocker with gear shift in my Chevrolet pickup.), the tuner is relegated to the passenger side of the dash, easily 1 ft. away & due to the size & depth of the tuner, is a TIGHT fit for connections on the back of the tuner, without being a knee knocker for those in passenger seat.. (Coax connections are made with right angle adapters to make it easier to install.)

Hello to all,

After making 2 tuning cycles my AT-100Pro stopped working.

Then I unpluged the power cord and connected it again and then all the leds turned on for 3 or 4 seconds, and then nothing.

No function, no antenna selection, nada.

I also tried a reset like in the manual, its the same.

What could it be?

Luis, CT2FZI

4036. Question about z 100 plus and random wire antenna

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-02-06 22:01:21 UTC
From: thomas c
Topic: 4036 Message: 4036

Hello All,
I am space limited in my location here and all I can put up is a random wire antenna.
I tried a g5rv and had poor results as I couldn't get it up high enough.
I purchased an LDG 4 to 1 balun as I thought it would be needed with a random wire antenna.
I have heard differing opinions as to 1 to 1 balun,4 to 1 balun,no balun,just use a banana plug on the coax output with a good ground AND COUNTERPOISE.
I have also been told the auto tuners aren't good for random wire antennas,that I would need a manual tuner with an inductor and a good capacitor to withstand arcing.
i also seem to remember a length of around 70 feet as being optiman.
Any suggestions would be most welcome.
To complicate matters my shack is on the second floor.
Thanks in advance for any and all replies.

Hi Howard,

You can make a new cable. You need to know how the connections are crossed.
It is a two wire cable.

The barrel of each connector is connected. The ring of the red radio plug is
connected to the tip of the black radio plug.

An alternative is to simply use (or make) a straight-thru extension cable.

If you send me your email I can send you a PDF file that describes it well.

I'm no expert but reading L. B. Cebik's FDIM 10 presentation
"Straightening Out the Inverted-L" leads me to:

* Use a length of 85 to 90 feet for the radiator, as high as possible
(ideally configured as either a 50% vertical and 50% horizontal inverted
L or as a sloper)
* Base feed at the ground level with an ATU - Cebik's article has
suggestions on the physical arrangement
* Use 16 15 foot long radials to 32 69 foot long radial wires
symetrically distributed at the feed point / the more you have, the
longer they should be for best performance!
* For 80 through 10 meters, excluding 60 meters, input impedance will
range from 70+220 to 660-460, suggesting that a 4:1 unun, with the
ability to be switched in or out of the circuit, would bring the antenna
within the 10:1 range of the AT100.
* 160 and 60 meters require a different treatment, perhaps a separate
wire length connected to the antenna 2 port. Too complex for me!

Of course local conditions and the installation configuration have an
impact on the as-built performance. In the end, we have to try it and
see! My conclusions are a simplification of SK W4RNL's paper and any
errors introduced in this short commentary are mine.

Hello DXchaser,

Page 14 of the manual talks about the bypass mode. After a tune, press once for bypass and press again for restore.

Auto mode takes priority. So if you bypass, then transmit and the SWR is over the set level, it will tune because it's in Auto mode. To keep the tuner from retuning, turn Auto mode off (page 11 in the manual).

Hello,

How are you doing?

Dwaine, could you please be kind enough to give me a hint?

My AT-100Pro is acting very strange:

When I power it up it will light all the leds from the left to the right and then all of the leds are on for 3 seconds.

After that they will turn off and no operation is possible.

Choosing the antenna, choosing the treshold, I just can't do anything...

I have tried to make the reset and checked the power and voltage before turning it on...

Nothing.

I think I have made something not good to my AT-100Pro: while trying to connect to the back of the radio the power cord, the plug touched the "radio" socket and I guess there was some kind of discharge.

Since that moment the tuner is acting like the description above.

Luis, CT2FZI

Hi Luis,

It's hard to say what has happened, but something has been damaged. Too late to say now, but always, always turn off the radio and power supply when making changes to connections. This is especially true if it involved DC power or an interface.

It may be something as easy as the microprocessor, or it could be something more on the PC board. There is no way to really tell without seeing the unit in our shop.

Thank you for your message Mr Dwayne.

Is this the right place to ask you how to send it to the LDG shop for repair?

Of course you are right, never plug anything with the power supply already on...

4043. Re: [LDG-auto-tuners] Question about z 100 plus and random wire antenna

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-02-07 20:02:31 UTC
From: Dan Thayer
Topic: 4036 Message: 4043

A while back, I had a 2nd floor shack in a condo. I ran an LDG tuner to a 4:1 LDG balun fastened to the exterior window casing.

The antenna was around 65 feet long. That's in the neighborhood of a 1/4 wavelength on 80, a 3/8s on 60, a 1/2 on 40, a full wave on 20, and 1-1/4 wave on 17. Ideally, you want odd multiples of a 1/4 wave

I had anticipated that tuning 40 meters would be a problem, as 65 feet is an approximate 1/2 wave on 40 meters, but the tuner handled it just fine.

I made a 1/4 wave counterpoise for each band, 80-10 meters, and attached their common end to the GND side of the balun. The counterpoise ran vertically from the balun down the side of the house, to a point about a foot or so above ground, and then was run around the foundation perimeter, supported off the ground by the foundation plants. (Be sure to insulate the ends of each counterpoise).

Initially there was a lot of RF on the short run of coax between the tuner and the balun, but I made a coil of several turns of the coax where it came through the window, and this was enough of a choke to end the problem.

The tuner would tune all bands, but was not really happy with 15-12-10 meters. It did work well on 80, 60, 40, 20 and 17 , considering.

It was far from the best antenna, but it allowed me to operate HF in an "antenna prohibited" environment.

I was never too worried about WHY it worked. I just know that it did.

Subject: [LDG-auto-tuners] Question about z 100 plus and random wire antenna

Hello All,
I am space limited in my location here and all I can put up is a random wire antenna.
I tried a g5rv and had poor results as I couldn't get it up high enough.
I purchased an LDG 4 to 1 balun as I thought it would be needed with

a random wire antenna.
I have heard differing opinions as to 1 to 1 balun,4 to 1 balun,no balun,just use a banana plug on the coax output with a good ground AND COUNTERPOISE.
I have also been told the auto tuners aren't good for random wire antennas,that I would need a manual tuner with an inductor and a good capacitor to withstand arcing.
i also seem to remember a length of around 70 feet as being optiman.
Any suggestions would be most welcome.
To complicate matters my shack is on the second floor.
Thanks in advance for any and all replies.

Hello Luis,

The return info is easily available on our web site. From the main page, click Support on the left side. Then click Tech Support in the middle. Just follow the easy steps to return your unit.

Hello Dwayane Kincaid

good morning from India, ?I had purchased an LDG Z11pro from W4RT in the month of August 2009. i had got the battery pack installed and was using it with 6 AA size batteries. it was functioning well and I was using it mainly on the 40 mtr band using a dipole antenna. of late i have noticed that i cant hear any relay clicking noise while i go up and down the bands. i checked on the other bands also and it is the same case. usually if i use this antenna on the other bands i used to hear the relays chattering and the turner tuning up. my rig is a yaesu ft857d and as far as 40 mtrs are concerned for which the antenna is connected now there is no speck of swr seen. of course on the other bands there is high swr but juz cant hear the relays working when i press the ptt and talk. the tuner is not in?bye-pass?mode also.

any ideas please, your help will be appreciated.

Hurray! It looks like we finally got the web site re-hosted and the e-mails all pointing in the right directions.

This week, we also added the final installment to the AT-200Pro instructional videos.

One other change is that we finally turned off the old LDG Help Desk.

There will be some more updates later this week.

1.6 appears to be the latest. It should be written on a label on the processor. 1.6 added 200 memories and is well worth the few bucks to purchase. It's about 4 years old now.

The Z-11 Pro. I also have a couple Z-100s with the same battery setup. Before they came out with the Z-817 I used the Z-100s.

Am totaly sold on the LDG product, and the Tech over the phone help.

One Z-100 came with the battery setup from W4RT, try out his site.

Bret,

It's possible that the IT-100 could be modified to use an external push button to start the tuning. However, we've never done it, so there is nothing wrote up on it.

The IT-100 manual has a diagram of the pinout and it follows the AH-4 protocol. So all the info is there if you want to try it.

If you are not an experience technician, I would not recommend trying it. If you know your way around diagrams, protocols and soldering irons, go for it!

4060. AT-200 Pro won't tune mobile antenna.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-02-14 04:14:26 UTC
From: txarphouston
Topic: 4060 Message: 4060

I've tried everything shy of sending it back to the factory.

Saturday afternoon took all coax & connections loose from my FT-857D & systematically re-connected coax & tuner connection cable to the Yaesu, still yield SWR higher than 3.0 to 1.. !

Step 2: Disconnected tuner, wired a mag-mount whip to radio & almost made a mobile contact to Albuquerque, New Mexico on a 10 meter mag-mount whip..

All coax connections have been double checked & DO have ground straps between radio & pickup chassis, tuner & pickup chassis & base of antenna mount to chassis..

Monday will pull the tuner & check in the shack of a friend with base station to see if the tuner reacts differently on another radio & antenna system..

Radio: Yaesu FT856D
Antenna: MFJ-1456 with NMO base (Similar to Larson TMB-34).
Duplexor: MFJ-916B

Have also substituted the MFJ-1456 antenna with a Diamond SGM911 with same results tuning on 6m..

hello Frank

you will not be disappointed with both tuners. i had sg 230 and z11pro
and both work beautifully for me. i prefer the z11pro for its compactness
and ability to work with AA size batteries installed which lasts for a
long time. in case you are mainly using antennas with coaxial feeders ldg
tuners are the best in the business.

pole or other portable antenna, and eventually 1% vehicular mobile.
So
far i like the specs of the Z11 Pro and the SGC SG-237. Thanks.

73,
Frank

Satyan,

How long does your 230 typically last? How do you power your SG-230? Through the coax? Is that how I would power an SG-237? Are SGCs better for balanced line?

What about the LDG AT-100 Pro II? Will this be good for portable use? Or was it designed mainly for desktop use? Thanks.

73,
Frank

Pierce,

We've never see a mod that continually shows the antenna selection, but sounds like it would not be very hard to do. One side of the relay is tied to +12 and the other is switched to ground when activated.

An LED tied to +12 and the other tied to the switched side of the relay through a resistor should come on when the relay is energized.

You'd have to drill a hole for the LED to go on the front panel. May have to use shielded wire and a bypass cap to keep it from lighting up when there is RF.

Sounds like a good project.

It appears the cable lengthening & replacing jumper cables between
the radio & tuner have not solved some issues I'm having with the
tuner, so will be sending the tuner in for service ASAP..

After installing a new antenna & checking grounding of radio, tuner &
antenna base, the tuner won't tune any of my antennas & consistently
results in SWR readings higher than 3.0 to 1, however running the
antenna coax to the radio directly (Tuner disconnected & jumper's
removed between the radio & tuner), the radio works like gangbusters
with a borrowed 10M mag mount as a _temporary_ measure, while my
other antennas are disconnected waiting the tuners return....

Hello to all,

Recently I have bought a FT-857D and for some reason [the only reason is my head] I am not being able to find the control cable for my AT-100Pro.

Does anyone have a spare cable for Yaesu that I could borrow/buy? :>

Luis, CT2FZI

Topic: 4069 Message: 4069

Thanks to everyone for your awesome responses, advice, and tips. I'm still deciding on an auto tuner for an 857D. I'll hold out a little longer, hopefully to find a good deal (and save up a little more money). Right now, I really like the LDG Z-11 Pro II and YT-100, and SGC SG-237. I also heard about the LDG AT-100 Pro II coming out soon.

This is how I plan to operate on 160m through 6m (and of course 2m and 70cm):

approximately 50% of the time:
from the home shack on the roof or metal fire escape on the 7th and top floor of an apartment building with a dipole or other stealth wire, fishing pole, or other portable antenna,

49%:
pedestrian mobile with a fishing pole or other portable antenna,

1%:
vehicular mobile later down the road.

Do the LDG tuners have to be located at the transceiver? Can they not be operated at the antenna feed point (more desirable for efficiency)? Can the SG-237 and other SGC tuners only be operated at the antenna feed point (less desirable)?

73,
Frank

Rick,

Here is what I have been able to learn. Some parts used on the original circuit board in the Z-11 PRO are no longer available. This forced a board redesign to accommodate the newer parts. Units with the new board are Z-ll PROII. Apparently, the specs,features, and operations are the same in either version.

Ray/Rick,

The only spec that changed is the operating voltage. It's now 6 to 16 volts at 300 mA. That allows 4 AA batteries to power it for about a year. You can even use a 9V battery for a weekend or two.

--

I am running mobile with the same tuner for a Yaesu FT-857D & have experienced much the same problem on 10M, good results with a Hustler 10M resonator mobile antenna with fold-over mount (Mount pole resonant on 6M), get a low SWR, but after change to a multi-band whip with appropriate loading coils, the tuner won't do anything to spite low SWR with a separate SWR bridge, the tuner & radio indicate higher (SWR 3.0:1 or higher) than normal SWR & will NOT tune the antenna, to spite separate SWR bridge saying differently (With tuner disconnected)..

My tuner is boxed & ready to be sent to factory (Under warranty) as soon as I can make a copy of the sales ticket.

4084. auto tuners for 6m

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-01 01:00:39 UTC
From: ZephyrNYC
Topic: 4083 Message: 4084

I noticed that there are a lot of tuners that go up to 30MHz than tuners that go all the way up through the 6m band. If you use one of the former, what do you do for 6m? Do you use a separate resonant antenna for 6m? Thanks.

73,
Frank

4085. Z-817 -RESET

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-01 01:24:56 UTC
From: Rudy Benner
Topic: 4085 Message: 4085

While considering a purchase of the Z-817, I was not able to find a method of clearing the memory of the tuner when one changed to a different antenna.

I THINK I have found an unpublished sequence that seems to clear the memory.

Holding in the TUNE button, initially lights the red led, continue holding the TUNE button, the red led will turn off and a few seconds later, the red and greed leds will sequence, Continue holding in the TUNE button until both leds are lit steady.

Can anyone confirm this?

Rudy Benner VE3BDR

yes, I know about the balun offer and have not yet applied for it.

Hi Frank,

I use a LDG Z11Pro tuner with one limited space wire antenna on 80 through 6 meters with no problems. Specs for the LDG balun I use say 1.8 to 30 MHz. but it still works fine on 6 meters.

We don't get a lot of 6 meter openings in my part of the country but when the band opens up, I have no problems making contacts.

From: Rudy Benner
Topic: 4085 Message: 4087

In reading my post, I can see that perhaps I had one too many 807s.

Hold down the tune button until the red and green LEDs stay lit together, Sequence up to that point is Red LED on, Red LED off, Red and Green LED alternating, then lastly, both stay on. Then release the tune button.

4089. RFI problem after installing a AT-1000Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-03 03:03:14 UTC
From: marv n
Topic: 4089 Message: 4089

After having a AT200Pro for about a year I thought I would add the AT 1000Pro to go with my amp. The radio is a Kenwood TS-480HX. I have the RF unit mounted in the basement with the head here in the shack, about 10ft from each other. I have been using a cat5 cable for over a year with no problems. Now that I have added the 1000Pro, I have all kinds of RFI problems even at less than 60 watts output. Some time back there was someone that had these two tuners and had the some RFI problems and he had listed a fix with a drawing of how he had his grounding layed out. I have looked high and low for this information but can't come up with it again.
I have tryed adding snap on torides all over the place. I have unhooked grounds, added grounds, changed cables and am not getting anywhere.
I really like these tuners but really need some help finding a fix for this problem.
Anyone know where I can find information on the problem when using 2 tuners?
Thanks
N0FJP

4090. Re: RFI problem after installing a AT-1000Pro

From: lostfrogsrecords
Topic: 4089 Message: 4090

Hi Marv,

I have a solidly grounded system, and up until recently never had a problem with RFI in the shack. Then I tried 6M, and ran into all kinds of problems, mostly with the amplifier complaining about high SWR and shutting down when used on 6M. I have a situation perhaps similar to yours, using an AT-1000 and AT-1000Pro. And this RFI problem existed when testing into dummy loads as well!

I used three turns of coax thru AmidonFT-193-J beads ($10ea.) on the coax jumpers from the amplifier outputs to the tuner inputs. That fixed my 6M RFI problems. Those beads are large diameter and allow the pl-259 connector on the coax jumper to pass thru easily.

I'm guessing that I need better shielding between the tuners (each other and the amp), since I can see the meter move on the tuner not selected when in use at power.

A drawing of my cure is shown as RIGwiring.pdf in the files section here.

4091. IT-100

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-03 14:14:05 UTC
From: Jan Erichsen
Topic: 3478 Message: 4091

I have an IT-100 tuner connected to an IC-706MkIIG in the boot of my car. I use Watson monoband antennas.
The problems are that, when pressing the tune button on the radio, or the one on the tuner, nothing happens, the tuner is dead. None of the light on the tuner comes on.
Shouldn't the lights come on when pressing the tune button on the tuner, even if the separation cable was not connected ?
I have checked all the cables, they are Ok. I have checked the ground, on the radio, the tuner, and the antenna. All are Ok, and there are no short circuits .
I have checked the 12v from the radio to the tuner, and it is OK. I have checked the separation cable, and it is OK
The tuner is only 4 months old, so I sent it back to LDG together with the cables, and they could not find anything wrong with the tuner, so they returned it to me
Have anyone experienced similar problems, or have anyone some useful advice.
Is there anything I have not checked?
This drives me crazy (or crazier).

I've got a similar problem with an AT-200Pro, on one antenna near back bumper of pickup truck, the tuner works like a champ, but on an antenna the other side, but further forward, show a high SWR on both the Radio display & the tuner does not perform.

I've give up on trying to make the tuner work & wish I hadn't bought it, as I'm now using a mag mount CB antenna that's been trimmed for the middle of the 10M band & do 250+ QSO's on 10M with NO SWR problems when the tuner is NOT attached to anything, BUT when the tuner is added to the equastion, the SWR issues crop up again..!

Oh, everything is grounded to the vehicle chassis with grounding straps, radio & tuner to the chassis, back bed of pickup to the chassis (Being the cab of "most" pickups is isolated from the chassis by huge rubber insulators to absorb the shock of rough roads.).

Maybe the tuner needs a shield around the vitals such a wrapping a lead shield around the tuner to keep stray SWR from the tuner in cases where the antenna(s) are in close proximity to the tuner..???

The antenna that works is mounted on top of the cab of the pickup, shows a HIGH SWR when the tuner is in the equastion, regardless of the tuner location & grounding..!

Right now the tuner is USELESS, removed from vehicle, monitoring antennas with an OLD Heathkit SWR bridge, ADD THE TUNER & SWR BECOMES AN ISSUE AGAIN, so the tuner is in the box..

Anyone want to buy an AT-200 Pro..?
(Has a lot of LED's that work as described in instruction sheet, BUT WILL NOT WORK in my mobile installation..!)

Howard,
Thanks for input. Your suggestion to wrap a lead shield around the tuner to keep stray SWR from the tuner might be the right solution to the problem. That's the only thing I haven't tried. Today I lent an Icon AT-180 tuner from a friend, and that worked flawless together with the rest of the installation ,without problems
of any kind

I think it is kind of silly to use lead since this is RF and not ionizing (x-ray / nuclear) radiation where lead would be beneficial. Aluminum would work fine :-)

4095. leds go out while tuning at-100 pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-04 18:53:46 UTC
From: w9gar
Topic: 4095 Message: 4095

I recently purchased a used ldg at-100 pro autotuner at a ham fest. The tuner seems to work ok except that sometimes before the tuning cycle is finished the leds stop working. It will then complete the tuning cycle without the leds working. I can push the func and they still will not work. I can then remove the power from the unit then hook it back up and the tuner leds work fine again. This seems to be an intermitent proplem, and does not happen every time. Has anyone had this problem?

thanks w9gar (Gary)

From: CT2FZI IM58KR
Topic: 4095 Message: 4097

Hello and 73

How are you doing?

I had a similar problem, but not exactly like yours... My AT-100Pro when turned on worked 100% ok but when I switch the antenna to a dummy load stopped working.

The leds would turn on (all of them) then turn off, and no other operation or signal from the tuner was available.

I send it back for repair and all the IC were replaced by new ones for testing and continued doing the same.

Finnaly the feedback from radioworld.co.uk was that something was happening with the internal tuner clock... resoldered all the board, then they let it cool down and after 50 tuning cycles the tuner was shipped to me, free of charge (still under warranty, great job from radioworld I must add, they have there a great tech!!!)

Don't know if this will tell you something but I think I should mention my issue.

Perhaps there is a component very sensitive to temperature in your tuner, or some solder point loose in the led board?

Whatever, but drastic attempts to tune a nearly $ 300. mobile antenna
with a tuner costing almost the same amount equaling frustrating
results, to be upsurped by a cheap (borrowed) CB antenna shows
equates to frustration..

I've got the tuner boxed & will be returning it to LDG by UPS as soon
as I can get to the UPS store..

Wy buy expensive tuners to tune expensive antennas when second hand
SB antennas & ham sticks (Can buy a lot of them for the cost of
either the tuner or multi-band antenna..

4100. New Cables from LDG

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-12 00:43:01 UTC
From: Dwayne
Topic: 4100 Message: 4100

LDG announces two new cables coming in April. The first is an Icom interface cable that is six feet long (two meters). This cable will work with LDG's generic tuners such as the Z-100Plus, Z-11ProII, AT-100ProII and the AT-200Pro. The part number is AL-PAC-6 and will cost around $15.

The second is an Alinco interface cable. It's 18 inches (0.5 meters) and interfaces the generic LDG tuners to the three popular Alinco radios: the DX-70, DX-77 and the new DX-SR8T. The part number is AL-PAC and will cost around $10.

Both cables will be available from LDG's distributors of cables and parts: www.cheapham.com and www.w4rt.com.

As a result of adding these optional cables to the product line, LDG will be dropping the "All Cables Included" program. Starting in March, the generic tuners will include the power cable, IC-PAC and coax jumper. The Y-ACC cable will be an optional cable. Obviously, radio specific tuners (such as the KT-100, YT-100 and Z-817) will continue to include the cables needed to interface to the radio.

4102. Using an Auto-tuner mobile

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-12 10:47:03 UTC
From: Don Wilschefski
Topic: 4102 Message: 4102

Hello Everyone,

I am thinking of buying an auto-tuner for use mobile. The LDG tuners seem to be very inexpensive, and use very little power. I have been told that I can use something like an 80m whip with an auto-tuner and use it on all HF bands. Has anyone used this system successfully?

My mobile installation is a coax fed whip. How short should the coax be between the tuner and the whip? Can I get by with RG-58, say 1 metre long?

As the tuner would be remote from the radio, can I use the tuning functions remotely? I think a cable can be fitted to the tuner to allow this.

Any assistance and advice is greatly appreciated.

Regards,

Don

Hi Dwayne ... look forward to the new Alinco cable.
I note you mention Z-100Plus and Z11-ProII

Is the Z-100 and Z11Pro classed as "LDG Generic Tuners" and will work with the new cables

If problems I've had with an AT-200Pro are any indication, you may
want to place the antenna as far as possible from the tuner, IF not
roof mounted..!

Grounding to vehicle chassis is most important for both radio &
tuner, as well as the ground end of the antenna..

I'm using braided cable to chassis, being sure to scrape chassis to
bare metal before attaching ground cable..

Howard Bingham, whose AT-200Pro is at the LDG shop getting a check-up..

Don,

We've never heard of anyone being able to get all HF bands with one antenna.

The model of radio that you intend to use would need to be known before we could say if it can be controlled remotely.

Howard has offered very good advice on grounding.

4106. Re:Using an Auto-tuner mobile

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-13 13:35:12 UTC
From: Sam
Topic: 4102 Message: 4106

When using a tuning circuit at the base of a whip antenna, you want the tuning circuit mounted as close to the base as possible. Also you do not want to use coax from the circuit to the antenna, just insulated wire. Just remember that the impedence of the antenna will change as you go down the road and the antenna moves towards and away from the metal surface of the vehicle, so if your tuning circuit is an auto tuner, you don't want to have it in auto mode as it will start tuning as the impedence changes due to antenna movement.

Rich,

The Z-11ProII does not have a factory reset. We found that there was rarely a use for it, so we took it out when we went from Z-11Pro to Z-11ProII.

You could do a search for the previous model and see what the sequence was. It might work, it might not, it might brick the tuner.

4112. Recall/version questions about AT-200PRO

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-19 14:53:29 UTC
From: david feldman
Topic: 4112 Message: 4112

Couple of questions about my AT-200PRO (just putting it in service after having bought it new some years ago; LDG didn't answer the same questions sent to them by e-mail)...

1. On what basis does the tuner decide to recall stored tuning parameter set vs. do a new full-tune? When I return to a prior frequency, how close do I need to be for the tuner to recall stored set (and tune quickly)? Also, does a change in the transmit power level affect this behavior (say, returning at 10W after previously tuning at 100W?)

2. Is version 1.1 (as seen on the front panel) current?

Thanks very much,

73 Dave WB0GAZ wb0gaz@...

Topic: 4112 Message: 4113

David,

Well, since no one is responding, I'll give it a try. The following is my understanding of how all the LDG tuners operate:

For each small frequency range, the tuner can store up to 4 sets L & C values. These four sets might be from four different antennas that you have used on this antenna port of the tuner, or they can be from changes to your antenna system - like making the feedline longer or shorter, or making the wire antenna longer or shorter, or even just changes due to the weather.

Now, the "small frequency range" that has 4 sets of L & C values, this range varies. At low frequencies, say 80m band, each chunk of frequency range will be larger than they are at higher frequencies like the 10m band.

On a memory-tune, it tries these four stored settings, one after another until it gets a SWR that is under the SWR Threshhold. If the first stored setting gets a suitable SWR, then it will not try the next 3 stored settings. The tuner can try all four settings very quickly - so quickly that it may still sound like one clicking noise rather than four clicking noises. If all four saved settings fail to get a suitable SWR, then a full-tune operation is performed.

Howard

Re: Z11-PRO II

The only spec that changed is the operating voltage. It's now 6 to 16 volts at 300 mA. That allows 4 AA batteries to power it for about a year. You can even use a 9V battery for a weekend or two.

Hopefully the older reset procedure would work with the new one as i can't see NOT having the feature. You change antennas or make changes to the antennas you are currently using, or different field day antennas, etc. It would mean more unneeded memories to cycle through to get to the one you want. I found it very usefull when i had the AT-1000PRO.

Sam,

The number of memories has nothing to do with what is stored in them. The tuner only looks at memories at the frequency that you are operating. So clearing all of them provides no benefit for reprogramming for a new antenna.

4123. Using FT-857D, OTT to Z100 and PC logger at the same time.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-03-30 12:24:38 UTC
From: ANDY - N1ORK
Topic: 4123 Message: 4123

Ok, here's the situation:
I have an FT-857D and an LDG Z-100 ATU. I use the LDG OTT tuner interface which connects to the 8pin mini-din cat port on the 857D. I also want to use the CAT port to interface with my laptop logging program to control the 857D (read and set frequency). I know that I can use the Y-ACC (little red and black cable between the data jack on the 857 and the z-100) to control the tuner and the 857 cat port to work with the logger. But then I need to first lower the power on the
857, manually hit the tune button on the z100, raise the power on the 857 and then transmit.
My question:
Is there anyway to use the both the LDG OTT tuner interface and the PC logger at the same time via an 8pin mini-din 'Y' cable or some sort of DIN switch?
73 and Thanks for any help,
Andy - n1ork

"Yes, but..."

You cannot directly attach the random wire to the tuner. You will need a balun, which fits between the unbalanced coax antenna output of the tuner and the end of the random wire antenna. LDG's 4:1 balun would be a good choice.

Take a look at this for an explanation.

Have you ever thought about making a tuner with 4X the matching range?

Instead of 6 to 1000 ohm, make it 2 to 3000 or maybe 1 to 4000 ?

Back when I used the AT200PC, I would often need a 4 to 1 UNUN to raise the impedence of my low to the ground 320 foot horizontal loop to be able to tune all the MARS frequencies I needed.

Some other brand tuners have a broader tuner range, and tunes my horizontal loop antenna much easier - without the need of an UNUN to help it.

Howard,

We look at that kind of thing all the time. Right now, we feel the 10 to 12 to 1 SWR range is the sweet spot for price vs performance. Any more range than that would significantly cost more and decrease the value of the performance that you would get in return.

The 10 to 1 range provides enough for many of the popular antennas currently being used. For those that have something outside of that range, an external balun or unun provides many installations with an easy solution (like what you were doing).

Hi Mike,

That's a great question. You don't want any of the VHF or UHF signals going through the tuner. The tuner only works (or passes) HF and 6M.

So from your radio HF output, then to the tuner, then to the HF port on the diplexer. From the radio VHF/UHF output to the VHF/UHF port on the diplexer. Then the antenna goes to the combined output of the diplexer.

It will work great and no antenna switch is needed.

From: kd5kjd
Topic: 4133 Message: 4133

Hello folks...

I was working on my mobile set-up the other day. In fact, I was upgrading from my trusty Icom 706 MkII-G and Z100 hooked up to a Hamstick 20M antenna to an IC-7000 and LDG 100Pro to the same antenna. I was switching out the gear and hooked up all FB, or so I thought!

In my rush to finish before sundown I hooked up the Transceiver and Antenna ports backwards! I didn't know I had committed such a mistake! I finished up and drove back to my home from my girlfriend's house two hours away. While driving home I keyed up the rig and tried to catch an opening on 17. Every time I tried to key the mike on ANY HF frequency the rig would shut down! I kept thinking it was stray RF getting back into my rig.

Two days later, in frustration I switched out the 100Pro back to the Z100. It was only then that I realized my mistake. I rewired and hooked up the ports CORRECTLY this time and keyed the mike. All of a sudden the 100Pro buzzed and clicked and clattered to life! It worked perfectly! I was gratified to learn that the tuner had NOT died due to my mistake.

Is it possible that these fine tuners have built-in protection for goof-ups such as mine? Are they built tough enough to withstand such mistakes? Or are they both?

I don't know, but I am happy to report that my setup works FB.

Currently, the 7000 and the 100Pro are tied to 3 Hamsticks I switch out: One 20M Hamstick works 10M-20M, a 40M Hamstick for the entire band, and a 75M Hamstick for 3900-3950. I could use the 20M Hamstick for 40M, but it'd only tune 7.250-7.300 with constant tuning after each frequency change.

My advice to you, read TWICE, hook it up correctly ONCE.

The 706 and the Z100 plus an MFJ PS and a G5RV are going into a box for EmComm work. I will provide pics of all setups soon.

Signing off for now... albeit a bit more than embarrassed;

Luis KD5KJD

P.S. I am considering putting an IT100 in a gray electrical box and using it in lieu of an Icom AH4. I wish the tuner handled more power as I'd like to add a mobile amp capable of 500 watts.

Bob,

Radio Shack does have a holder. They have a spring clip design for 9 volt batteries, as well as the battery connector w/ leads. I have picked up several of these at Radio Shack. In my option, the reason why LDG does not offer this type of accessory, is that I don't think they recommend using the tuner that way. It does work, but really needs 11+ volts to work well. At least that is how mine is. On 9 volts (or less) some tuning issues develop. Anyway, my two cents worth.

Try the Radio Shack web page, as they offer many items not found in
all the stores..

I don't know what type of holder is needed, but have picked up
holders for both 4 & 6 AA batteries in recent past (The 4 battery
holders typically have a connection similar to that found on 9v batteries.)

Hi Bob,

We don't include the holder as not everyone needs one. Our polls show that a very small percentage if users operate the Z-11ProII from batteries. However, we altered the design and added the solder terminals for those that want to run it on 6 internal AA batteries. The manual has several links to places to purchase the holder as well as the excellent suggestions provided from the group.

From: k3mrk
Topic: 4142 Message: 4142

Hello
I am new to the group and could use some help with some questions.
I am getting ready to pull down my existing OCF Dipole and put up a 130ft, somewhat inverted Vee fed with 450ohm ladder line. The ladder line run will be approx 70ft. i then want to run the last 10ft to the tuner with 50 ohm coax. I use an AT-100pro, so I have to run coax to the tuner. the last time i used a balanced feedline, i had a roller inductor tuner with the balun built in.
I was pretty sure I was going to get the LDG 4:1 current balun for this set up. Now I am seeing some references to using a 1:1. I'm trying to learn as much as possible about baluns to make the right decision. But I'm not there yet. the more I read....the less I'm sure.
The antenna will be of equal lengths on both sides. the apex will be at about 60ft and i will work mostly 80-17m.
So what are your thoughts?
Thanks in advance for the help.
Mark

As far as the Z11/Pro,the solution that I use in my setup is to install one of the lowcost 12 volt model airplane NmH batteries andjust plug it into the socket, easy finds on E*ch. On the second one I went a bit overboard and found a 12 volt NmH pack that fits inside th case, drilled a small hole with a gromet and the plug hangs outside just long enough to connect to the power jack saves on a switch but still self contained, made a small adapter to charge the pack when needed.
No point pulling power from the FT-817....
When I did this I installed a small 9:1 inside of the Pro, small mini switch and a RCA as the long wire feeder, works like a "gangbusters"

Hello Mark,

How are you doing?

When people say 1:1 balun they are referring to a CURRENT balun.

Both LDG balun are VOLTAGE.

The firs ones work fab on loops, ladder line feedline, ocf and dipoles...

Just wound 12 to 14 turns of figure 8 wire (1mm each threads, insulated) or
RG-316 or similar in a FT-240-61 toroid and off you go.

In example: http://www.karinya.net/g3txq/temp/current_balun2.jpg

Note that the "cross-over" in the winding of the RG- 316is not essential -
it's just a neat trick to put the output side of the balun opposite the
input side.

Or use the "ugly balun": http://www.hamuniverse.com/balun.html :D

Please read the ugly balun site, good stuff.

I got best results using a 4:1 UNUN to increase the impedance.

A typical 1:4 balun reduces the impedance by a factor of 4. I used a 1:1 balun and then a 4:1 UNUN to INCREASE the impedance.

One needs to remember that a low dipole or horizontal loop antenna as much lower impedance compared to one that is mounted high in the air.

Tuners are typically weak on matching a low impedance antenna.

Hello group,

Not to be picky, but of course you will get different results in different setups, in different bands.

The best you can do is to build 2 baluns with a switch.

Have a look here: http://www.qsl.net/n1lo/n1lobaln.pdf

You will have both worlds, different bands will work with different baluns.

That said a 1:1 CURRENT balun is better than any voltage balun ;)

How about it, LDG? Is my z11pro2 going to work correctly with 6 AA's used as power for it? I found some holders on the internet but won't waste my time or money if it won't work on 9V.

It sounds like I need to do some experimenting. That's means my most economical solution is to build whatever I try. Baluns and ununs are not cheap to buy. My main objective is to get the ladderline to the tuner. The LDG tuner I have wont handle a balanced load. Thanks for the suggestions. Much appreciated.

My question to Paul would be what specifically are the "tuning issues" that develop?

Hi Bob,

As the specs on the LDG web site say, the Z-11ProII goes down to 6 volts. It was the Z-11Pro (plain) that required 11 volts or higher.

A 1:1 choke balun is probably the best place to start. Simple and effective. Get a good core and wind small coax or a pair of #14's taped together. If that is insufficient you can add impedance transformation later, but keep the 1:1 for balance.

4155. Re: which balun?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-06 17:09:03 UTC
From: Howard Z
Topic: 4142 Message: 4155

This is the UN-UN I purchased when I used the LDG AT200PC tuner. This tuner needed "help" from an UNUN or BalUn as it did not have enough tuning range. Particularly for low impedance antenna like a dipole or horizontal loop low to the ground (10 to 20 ft high).

http://www.cwsbytemark.com/ununs/1.78to1-HMMU50.pdf

It costs $65 and has many connectors to try different ratios:
1.26:1 1.78:1 2.25:1 3.06:1 4:1 9:1 12.25:1 and 16:1

Then if you connect the antenna and radio to opposite sides you get ratios: 1:1.26 1:1.78 1:2.25 1:3.06 1:4 1:12.25 and 1:16

So you can use this to either lower the impedance or to raise the impedance. I wish it had BNC connects, as that makes moving to different ratios quicker and easier. I ended up buying several PL259 to BNC-F adapters.

I believe this is a voltage UNUN, not a current one.

4156. yt-100 Questions

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-06 18:58:51 UTC
From: Glenn and Linda Feldhouse
Topic: 4156 Message: 4156

Hi all,
I am the proud owner of a yeasu FT100 d radio that I use as a portable rig.
I would like to get a YT-100 tuner for this radio but I have a couple of questions first.

After reading the manual and watching the you tube tutorial I still can't figure out if this unit will act as a normal autotuner. If it is at or near a frequency that is stored in memory will it instantly tune to that freq. without pressing the tune button?
Will keying the mic initiate a full tune as my at 200pro does or is it necessary to press the tune button to get the tuner to function each time the frequency is changed or say a different antenna is connected.

Thanx
Glenn KB1FFE

Hello group,

Not to be picky, but of course you will get different results in different
setups, in different bands.

The best you can do is to build 2 baluns with a switch.

Have a look here: http://www.qsl.net/n1lo/n1lobaln.pdf

You will have both worlds, different bands will work with different baluns.

That said a 1:1 CURRENT balun is better than any voltage balun ;)

Im trying to put a balanced feedline to an unbalanced coax run to the radio.
I always thought this required a BAL/UN

From: LDG-auto-tuners@yahoogroups.com
[mailto:LDG-auto-tuners@yahoogroups.com] On Behalf Of Howard Z
Sent: Tuesday, April 06, 2010 1:09 PM
To: LDG-auto-tuners@yahoogroups.com
Subject: [LDG-auto-tuners] Re: which balun?

This is the UN-UN I purchased when I used the LDG AT200PC tuner. This tuner
needed "help" from an UNUN or BalUn as it did not have enough tuning range.
Particularly for low impedance antenna like a dipole or horizontal loop low
to the ground (10 to 20 ft high).

http://www.cwsbytemark.com/ununs/1.78to1-HMMU50.pdf

It costs $65 and has many connectors to try different ratios:
1.26:1 1.78:1 2.25:1 3.06:1 4:1 9:1 12.25:1 and 16:1

Then if you connect the antenna and radio to opposite sides you get ratios:
1:1.26 1:1.78 1:2.25 1:3.06 1:4 1:12.25 and 1:16

So you can use this to either lower the impedance or to raise the impedance.
I wish it had BNC connects, as that makes moving to different ratios quicker
and easier. I ended up buying several PL259 to BNC-F adapters.

I believe this is a voltage UNUN, not a current one.

WOW!

What a great article! Im learning more from this than the last 10 I read.

Thank You!!!

Does a good job of selling me on DXE also.

Subject: [LDG-auto-tuners] Re: which balun?

I recommend checking out this article:

http://www.dxengineering.com/techarticlepopup.asp?ID={3E5220F7-2D0F-45B5\
-85F7-3B654F804C4F}

It describes most antenna scenarios and their appropriate BALUN style.
So-far their advice has been correct at my antenna farm <g>!

From: Howard Z
Topic: 4142 Message: 4161

A really time-tested antenna approach is to use:
1. A one wave length loop antenna cut to proper length for the lowest Mhz frequency one wants to use (or it can be a dipole, but a 1WV loop is better)
2. Feed with 450 ohm ladder line (use the correct length for the lowest frequency even if you have a bunch of it left over)
3. Use a 1:1 balun (or you can just connect the ladder line to the coax and put a bunch of large toroids around the first foot of the coax cable.
4. Keep your coax short - 5 to 10 feet. You don't want ladder line in your home - it will radiate and interfere with computers and other electronics.
5. Use a tuner with a broad range to tune everything above the design frequency.

So, let's say you put up a wire antenna - one wave length loop going around your property - cut for 160 meters. Now you can tune everything from 160 meters to 10 meters with a good tuner. One antenna that will work well for all of HF. You don't have enough land? Then cut it for the length to be resonant at 80m, and it will work from 80m to 10m.

The fact that there will be high swrs going through the ladder line just doesn't matter as there will be very little signal loss using 450 ohm ladder line compared to using coax cable.

This system works - works well - and has been in use since before we were born.

The problem is - an LDG auto tuner can't do the job without help of an UNUN, and you might need to change the UNUN ratios for different bands.

To do this reliably without playing with an UNUN, get a Palstar manual tuner or the Palstar auto-tuner. They have huge capacitor and inductor coil inside that have the range needed for this antenna setup. There might be some other tuners out there that can do this job, but I don't know about them.

4162. AT-1000Pro putting IC-746Pro in tune mode when radio is turned on.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-07 22:59:31 UTC
From: wb8nbi
Topic: 4162 Message: 4162

I just received my new AT-1000Pro yesterday and seem to have a small problem. When I turn the 746Pro on it goes into tune mode the tuner does not tune but the radio puts out a 10 watt carrier until I hit the tune button on the tuner. After that it is fine and works great until next time I turn the radio back on. Any one??? By the way I hooked up my AT-200Pro to the 746Pro and it does not happen.

4163. Z-100Plus performance on 40m with 19feet ground plane

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-09 00:56:36 UTC
From: victor
Topic: 4163 Message: 4163

This is a E-mail I had sent to Ldg support:

I bought the Z-100Plus autotuner through Chipham about two months ago.
I am using it with a vertical ground plane antenna, 19 feet long and with about 16 radials with lengths ranging from 15 feet to 40 feet.
I was not satisfied with the antenna performance, so I tested it on the 40m band on the frequency of 7.1MHz.
The Z-100Plus seems to tune correctly giving low SWR at the Transmitter (the Z-100Plus ATU was at the base of the antenna and the transmitter was connected through 40 feet of RG-58 coax).
The transmitter field strength was carefully measured at about 40 m distance; then the Z-100Plus was substituted with a home-made matching network made of an inductor in series with the antenna (To tune out the antenna capacitive reactance) and a 1:4 step-up autotransformer to bring up the low antenna input resistance to be closer to 50 Ohm. The SWR with this network was low too.
The field strength measured with the home-made matching circuit was about 6dB stronger than with the Z-100Plus.
The power used was 20W so there is no danger of damage in the Z-100Plus.
I opened the Z-100Plus to make sure it is not damaged and everything seems to be just fine (including the wire connections to the RF connectors).
The processor has a sticker on it printed with "Z100 + 10".
Do you have any explanation of the poor performance of the Z-100Plus?
Is the firmware up-to-date?
Any suggestions?

Does anyone have similar info? Did anyone made direct efficiency measurements for different length antennas?

Victor - 4Z4ME

I was under the impression that most current Kenwood models had a
built in tuner, or is this an older unit..?

I have an LDG AT-200Pro that I would be willing to trade for a
slightly smaller & more compact model (Still in box after diagnostics
& upgrade at LDG under warranty which runs another year.).

Looking for a model more suitable for a mobile installation..

Are you running the latest firmware in the FT-950? According to BetterRF the lastest FT-950 firmware thwarts the BetterRF adapter by checking for 3:1 match befor it will tune.

Is anyone running the lastest firmware in an FT-950 with any external tuner? I am wondering if the software change could thwart any external tuner.

4170. New 600 Watt tuner from LDG

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-16 14:09:46 UTC
From: Dwayne
Topic: 4170 Message: 4170

LDG has announced the AT-600Pro Autotuner. It will handle 600 watts on SSB and CW, 300 watts on RTTY and 250 watts on 54 MHz. Features include an LED indicator for antenna selection and an LED to indicate when in bypass. Delivery for the AT-600Pro is mid June, 2010. Look for the manual and web update shortly. Suggested Retail Price $359.99.

you don't need that BetterRF tune control at all. I use my 950 (and FT-450)with both an LDG AT100Pro and Z-11Pro.Both tuners tune just about anything hooked up to them.I don't know why people insist on using that BetterRF thing with RF sensing tuners,either set the LDG to auto and just start talking or set the rig to CW or AM and send a carrier for a second or two and be done with it

From: i4mfa
Topic: 4174 Message: 4174

I am the owner of a LDG Z11Pro.
While backpacking with my FT817ND using a ATX WalkAbout whip with just one counterpoise wire, I say (after having tailored the tuner on all bands / whip configurations) my call sign once and it automatically tunes (one second.

Great!

Anyway, I was wandering if some kind of REMOTE (tuner is backpacked) and possibly AUDIO alert for HiSWR (shouldn't happen, but...) could be implemented.

What about a piezo buzzer (or iPhone busser) in parallel to red led?
What about a ptt-down plus atu-offline way to do some kind of alert?

Thank you for your suggestions,
Marco, i4mfa w4mfa

Bill,

Thanks for the update. We'll that certainly is a bummer that Yaesu would change the code to keep people from using other brand tuners.

The way that Yaesu can do that is they have a dummy load pad in their tuners that kicks in to limit the SWR to always be below 3:1 while the tuner is tuning. Then the algorithm just does the tuning scaled with the dummy load in line. When it's finished, it takes the dummy load out and the tuner still has the lowest SWR.

However, the only thing that this effects is tuners that use the tune button on the radio, like the BetterRF adapter. I don't know of any other tuner that uses the tune button on the radio (maybe MFJ).

It does not effect any LDG tuner as we don't use the tune button on the radio. We had thought about doing that, but certainly won't pursue it now!

I notice that some of the newer literature on their own external random wire tuner now has "3:1 input" in the spec. Without more information is is hard to really know, but they may have crippled their own autotuner as well.

If you guys are going to Dayton, it might be worth a trip to the Yaesu booth on an information extraction mission. When I used to go to MEDTRADE in Atlanta, I was not above pumping a competitor wearing a borrowed badge:)

The whole thing seems really odd.

Found a battery holder. Tuner works fine. I sent off a copy of my receipt and the coupon for the FREE Balun from LDG. Received it yesterday in the mail. THANKS LDG!

I've been using the RBA 4:1 balun from LDG but recently found that it's not really capable of 100 watt continuous duty operation (I melted it!!)
I could feel quite a bit of heat on the case in normal 30 watt operation on digital modes and when I tried full power, it died.

Here's what I'm using now:

http://www.balundesigns.com/servlet/the-71/qrp-4-cln-1-current-balun/Detail

This little puppy feels cold even after 10 minutes of continuous 100 watt operartion. It's their "QRP" version but users say it runs at 400 watts without heating!!

Now the AT-200Pro LDG tuner is another thing. I don't think I'd better try "high power" ops with it anymore. It's also rated at 200 watts, like their balun, but that's not continuous and the tuner gets warm at that power level quickly!!

I use a FT817ND with a Z11Pro feeding a ATX WalkAbout whip, with just one counterpose wire, in my backpack.
I am used to have it in AUTO mode and to let it AUTOMATICALLY tune based on the power generated by my first one-two seconds of tx (usually my call sign repeated twice each time I start to tx on a new segment / band).
It tunes so quick that you have no problems at all, just be sure to have enough (0.25-1w) power level for one second.
I have to say that FT817ND is a 2.5w tx, so even if a HiSWR is present, to dissipate 2w you just need a finger of metal!

I taylored the tuner this way:
a1. 20m, 14.200, whip with 20m coil selected, 20m counterpoise length, long-pressing (full tune, write to memory);
a2. I repeat above step for all (1 to 4) freqs I tx nearby(14.15, 14.25, 14.30);
b1. 17m, c1. 15m, d1. 12m, e1. 10m I repeat steps 1. and 2. for these bands, with couterpoise length selected to that band (I call this ANT1)
cc1. 15m, 21.30, whip with 15m coil (proper band) selected, *20m* counterpoise, long-pressing (full tune, write to memory)(I call this ANT2);
cc2. I repeat above step for all (1 to 4) freqs I tx nearby (applies to 15M to 10M;
ccc1. 15m, 21.30, whip with *20m* coil selected, *20m* counterpoise, long-pressing (full tune, write to memory)(I call this ANT3);
cc2. I repeat above step for all (1 to 4) freqs I tx nearby (applies to 17M to 10M;
This way I have three VIRTUAL antennas (1=proper coil, proper counterpoise, 2=proper coil 20m counterpoise, 3=20m coil and counterpoise) and as Z11Pro memory banks see 4 antennas for each bank I am able to let if find proper tune on all (5) bands even if I have no time to properly switch my antennas configuration.
80m and 40m uses a standard (first described tecnique) as, due to counterpoise length, I use these bands on portable only, non on pedestrian.

Hi Dan,

That is exactly correct. All LDG products are rated in PEP. So when something says 200 watts, that's 200 watts PEP, not continuous.

4184. balanced line & metal-framed windows

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-22 21:31:34 UTC
From: ZephyrNYC
Topic: 4184 Message: 4184

Hello, everyone. Does anyone in the group feed an outdoor antenna with twin coax or regular (non-coax) balanced line going through a metal-framed window? If so, what kind of problems do you experience? AFAIK, using balanced line near metal is a big no-no, but I read this today:

Regular balanced line:

http://www.mail-archive.com/elecraft@.../msg30984.html

"... you can cross a metallic boundary with parallel feedline with no problem to the RF as long as it occurs at right angles to the feedline - again be careful that you have adequate insulation where you cross, the RF voltages can be quite high even with low or moderate power if the feedline has a high SWR."

And this on balanced (twin) coax:

http://eham.net/ehamforum/smf/index.php?topic=66987.0

"I would like some advice on feeding 450 ohm window line at right angles through aluminum siding. It's the only way I can do it! Can I get reasonably close at this right angle? or do I need several inches around etc."

"If you want to be entirely safe about it, you could change the ladderline to two side-by-side coaxes for the short final run through the siding and to the shack.

Connect an inside conductor of each coax to each of the balanced line conductors.

At the balanced line side, connect both coax shields together and solder. Insulate all three connections from each other well, using weatherproof tape or something suitable.

At the shack end, connect the two center conductors of the two coaxes to the balance line connects. Connect the two shields together and also connect them to shack ground.

This will create a shielded, balanced line that can cross conductive metals without problem. You could pass the two side-by-side coaxial cables through the siding through one tight pass hole or two, doesn't matter as they are now shielded but still running in blanced mode.

Old trick that works."

More on regular balanced line:

'But seriously, I'm sure you've heard that you have to "keep ladderline several inches from metal."

Right angle crossings don't really count.

The important thing with keeping ladderline away from *metal* is that you don't want to run it for a long stretch close to and in parallel with a third unbroken conductor, because that turns it into a different kind of feedline, one that has a lower characteristic impedance and generally one that has more loss in the situations where people like to use ladderline. So that's what you want to avoid. And if you ran it very close to a long stretch of lossy, damp material like dirt, the way the fields interact with the dirt would cause a lot of very direct loss.'

More on balanced (twin) coax:

http://forums.hamisland.net/viewtopic.php?f=4&t=4793

Aside from differences in shielding, weight and cost; what are the pros & cons of using balanced coax vs. regular balanced insulated line?

Does RF from balanced feedline really cause interference to pacemakers and other medical devices? I am curious because my apartment window frames seem to be constructed of aluminum, and I have plans for an antenna that will probably need a long feedline. The two windows are approximately 4' and 15' from the edge of a metal fire escape. Thanks.

73,
Frank wF2ANK

Zephyr,

Last time I tried ladder-line coming into the house (via a small PCV pipe going through a wall) it radiated so much stray RF that it interfered with my computer and USB devices.

I think that was the first and last experiment with ladder-line inside my home as I do not know how to prevent the ladder-line from transmitting RF in the home.

Hello Mr Howard,

I also had the same experience using 50ohm coaxial cable. USB mouse stopped working, the keyboard started to beep, serial to usb adapter stopped working.

Its not a ladder line issue.

Were you making the transition from the balanced feed line to a non balanced system using a 1:1 current balun?

Coax cable is not balanced.

If you were connecting the ladder line directly to your tuner, be aware that there is a jumper wire that you may have to use on the back of your antenna tuner..

Ladder line works great. Its not lossy...

Just to add this:

If you were connecting the ladder line directly to your tuner, be aware that there is a jumper wire that you may have to use on the back of your *NON LDG *antenna tuner..

Other brands, that is.

If you use your LDG antenna tuner you should at least use one 1:1 current balun. In some bands you will need a 4:1 current balun.

:)

4188. Re: balanced line & metal-framed windows

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-04-26 18:14:09 UTC
From: Howard Z
Topic: 4184 Message: 4188

Luis,

I was using 450 ohm ladder line and connecting it directly to a non-LDG tuner which has a built-in 4:1 balun. The tuner has a button to select between the Coax and the Balanced antenna connections. No wire to move. I figured - as you mentioned - that there would be less losses with ladder-line versus coax.

The only problem was RF effects to my computer equipment when I would transmit. I have not heard of anyone putting beads on ladder-line cable - I'd tend to think this would not fix the problem.

So, that was my one experiment with ladder line in my home. The solution at that time was to go back to using a 1:1 balun just outside the house and run about 10 feet of coax cable into the house.

However, I'd be interested if you or others have managed to run ladder-line in their home without these negative affects to computer equipment. What precautions prevented this problem?

Howard

Hello again Howard,

I hope that you had a good day today! It was very sunny in Lisbon: 25º C.

Regarding the non LDG tuner, you should wire the balanced binding posts to one non balanced (called random wire I guess). Even with the front selection button you should make this bypass.

The built-in balun is a voltage balun, not current. I do advise the usage of a current balun in all ways..

Your usage of the small length of coax and a 1:1 balun is OK, and you should always use a balun, even if you have it inside the shack.

My older computer is affected by RF but because I have the antenna less than 2 meters from it and I do have to use a coax choke balun and a 1:1 current balun at the same time! :D :D

The only thing I remember is to be sure that the ladder line stays outside, the solution you managed doesn't work with you? (coax from the outside to the inside)

I looked on BetterRF's web site today. The references to a simple modification to make their product work with a FT-950 have been removed. So I guess its official.

Bill - AB6OR

I spoke to him via email last week & he confirmed that Yaesu did make a change recently in one of the PEP updates and now his accessory no longer works with the FT-950. There are no plans to re-engineer the Better RF tuner accy for the change...

From: yandan8
Topic: 4192 Message: 4192

Good Morning,

I have a Yaesu FT-857D that needs an auto-tuner. I figure I'll get an LDG. But I can't decide which one to get. The Z-100Plus seems almost identical to the YT-100, except with two pluses from my perspective: 1) batteries capable, and 2) smaller footprint and lighter -- for portable use. So why would anyone buy the YT-100 for the 857?

Thanks.

Consider the Z11 PRO, too. You can have a battery holder installed in it
for a few bucks extra or do it yourself.

Half the guys in my club have them...sort of like having an official
club tuner! LOL.

Hello to all

My name is John (K5JRW) I am new to the group been a ham since 1980.I just replace my old mechanical mfj tuner with the 100pro/2.I have a 160 meter zepp up at 70 feet with around 70 feet of 450ohm ladderline into 4:1 balum.I was able to tune all bands with the mfj, but now I can tune all bands but 160 meters I am looking for any ideas as to why.My first thought was maybe I need to adding more ladderline.I have not tried this yet but any ideas would be most helpful.
Thanks.

Thanks for the comment but you're making it harder, not easier, to decide. :-)

Not sure why LDG does this. The "differentiators" for these products are nowhere to be found in their literature.

John,

The first thing to do is to check to see if the antenna is within the tuning range of the tuner on 160. Most manual tuners have a wider tuning range than most autotuners, so I'm suspecting this will be case here.

Using an autotuner on 160 is usually very difficult as the SWR rises very, very fast once you get away from resonance of the antenna.

Yandon,

The tuner comparison chart has a link on the LDG Yahoo group main page. It's also accessible from the Autotuner page on the LDG web site.

Yes, I was aware of the chat. Don't know about everyone else, but LDG's comparison chart still leaves me with my questions regarding why one product over another.

Yandon,

What specific questions do you still have?

For most people, it's a personal choice: Do you like more button and lights or a more simple approach? Do you want to be in control of the radio or let the tuner do it? How important is battery operation to you?

You'll have to give us more information on your personal preferences to go on.

Hello?

i have an 857d and a z11pro with battery option. when i am stationary i use it with the 13.8v power supply i have for my rig and when i go mobile at times i put the?batteries?in. 857d and z11pro are sort of made for each other set up.

Thanks for the help.

As someone recently said about this hobby, the budget has to be the constraint. So it is for me.

I honestly don't see what one gets for paying $40 more going from the Z-100+ to the YT-100. Any feature difference in the chart, except for Tuning Range, seems to be a negative. (Batteries is an option the YT-100 doesn't have, so that is a negative.) Plus its a bigger box (also negative from my perspective). So why do folks buy the YT-100? What is it I'm missing?

With respect to the Z11Pro. I associate LDG with automatic tuners (simplicity preferred), so really haven't focused on the Z11Pro.

4204. AT-600Pro Web Update

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-05-12 17:28:40 UTC
From: Dwayne
Topic: 4204 Message: 4204

For those of you waiting, the LDG web site has been updated with the description, specs and photos of the AT-600Pro. We are still on track for a June delivery.

Also the new longer interface cable for Icom radios and the new Alinco interface cable should be available at www.cheapham.com in June.

Dwayne Kincaid
LDG

4205. A quick thankyou for customer support

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-05-13 14:18:31 UTC
From: m0rjc
Topic: 4205 Message: 4205

I asked about the 4:1 balun and earthing when the tuner was close to the balun. The answer was not to ground the tuner in this situation. I also asked about the pin-out of the Radio socket on the back. It's good when customer support provide answers to those kinds of questions, and quickly too!

I've been using the Z11-Pro tuner at the antenna end of the feeder, to feed a wire antenna through the 4:1 balun. I've worked QRP so far and found that it works well. I'd considered adding some form of remote control and display for it. It's not an idea I've pursued far - and to be fair the tuner does work well in Auto. My radio (Yaesu 897 - and a borrowed 817 when I went portable last weekend) has a SWR display which gives an idea of what's going on. Once you've populated the memories for your antenna, tuning is very quick.

Reading more about cable loss in mismatched situations I'm not so sure whether placing the tuner at the radio end would really be much of a disadvantage over placing it at the antenna end as often suggested.

- Richard (M0RJC)

4207. 1:1 Balun

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-05-14 01:36:14 UTC
From: cam55orange
Topic: 4207 Message: 4207

I put my free promotional 1:1 balun to good use.

I cut the SO-259 connector off of my G5RV and attached the Balun. The antenna tuner seems to be able to find a better match faster. There is also less RF creeping back into the house. The improvement is most notable on 30m.

4208. AT-11MP needs repair

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-05-15 23:36:17 UTC
From: sly
Topic: 4208 Message: 4208

Guess I need to send in my at-11mp to be fixed. It just clicks away making its "sewing machine" noises but will never tune even though the meter is swinging up/down. I also need to get the latest "chip" installed as it is about 8-10 years old (1.6?).
Anyway does anyone know what LDG might charge for repair and upgrade and turn around time?
Thanks
Sly-n5gqb

Sly,

It's about $35 plus shipping and about two weeks counting shipping time.

From: Ken Bandy
Topic: 4210 Message: 4211

Sorry to tell you this, but neither one of these antennas are rated for the 80M band. If you have an antenna analyzer, hang it on the coax feeding your tuner from each of these antennas. It's probably going to be over an SWR of 10:1. Even if the tuner could tune these antennas, they wouldn't be very efficient, basically a large "dummy load".

Sorry.

Ken

Understand that the G5RV Jr is not rated for 75/80M & I am not trying to use it on 80M's, the 14AVQ is a 10-40 M antenna but when you add the MK-80 modification it takes it to 80 meter with a narrow tuning range, and I have tuned the antenna to cover 3.850 to 3.950 the SWR is 2.2 in the middle 3.9 and 5.5 on both edges of the range, I don't understand AT-200 why it will not tune. SWR was measured with Antenna Analyzer MFJ - 269

Does anyone know the last revision that worked with the Better RF device? Knowing the rough date would probably be good enough.

Topic: 4214 Message: 4214

I'm running an AT-100Pro from a Yaesu FT-950. I rely on transmitter rollback - no interface between the tuner and the radio....I know....

The 950 is set for an external tuner and until recently the tuner worked well. Now, when I transmit, the AT100Pro does not automatically enter tune mode when presented with an SWR above the threshold setting - I've tried changing the setting down and up and have it set at 1.7:1

I can force it to tune manually - but no auto tune....what am I missing? Also, It doesn't seem to remember settings once tuned to a freq on a specific antenna. Primarily running a flat top dipole at about 30 ft.

TIA for the list's help.

Hi everyone I am having a hard time using the tuner. I have a FT-857D and have the cable connect to the radio and tuner. When I try to tune the antenna using the tuner. I hold down the tune key for a full tune. the tuner has the 1.5 and tune are on. When I let go of the tune key the only light that is on is the Tune. And when I key up the radio in AM mode the tuner tunes. Has this happened to anyone.

Thanks
Al, kg6qdi

I gusss I am having a little trouble understanding your post. My fault. When you say 'cable connected to the radio and tuner' do you mean that you are using the BetterRF device? When you say that the 'only light on is Tune' do you mean that the tune light on the radio is on solid? When you press tune on the radio do you mean that the LDG tuner does nothing?

Is you radio set to external tuner in menu?

Sorry for no help and lots of questions.

To ALL my American friends everywhere.

I wish to take this Time to wish all my American friends a safe, happy and healthy Memorial Day Weekend. But PLEASE take the time to remember what it is all about. Take a few minutes to remember all those who have died in the service of their respective countries, not only Americans, but all her friends and allies as well. Remember not only those who have died in actual actions, but those whom have been wounded and died later as a result. In some cases YEARS later. Also remember and give thanks to those whom have been wounded and lived for years carrying those pains and scares. Remember the families and friends of those lost.

JUST GIVE THANKS THAT WE ARE ABLE TO HAVE THE FREEDOM TO EVEN POST MESSAGES SUCH AS THIS.

GOD BLESS AND KEEP SAFE THOSE THAT FIGHT FOR OUR FREEDOM EVERYWHERE.

Topic: 4229 Message: 4230

Hi Murf,

That would be fairly difficult to do. The meter movements in the AT-1000Pro is controlled by the software. If it were directly driven by the RF sensor, then it would be a simple matter of adding a capacitor to slow the decay.

We've been working on a software upgrade for many months that will add peak reading to the AT-1000Pro. It's not quite ready yet, but we're hoping to have it available next month (July).

From: w_r_adams1
Topic: 4233 Message: 4233

What wire lengths, geometry, height, etc. do you use when going portable with your autotuner? Do you have recommendations for best practices on temporary setups?

Please share your successes and things to avoid.

I am gearing up for 40, 30 and 20 meters with an AT-100 PRO. I have a 12 v 7.5 ah battery, switchable 1:1 / 4:1 balun, tv twinlead, 50 feet of Rg=8X, 35 feet of guyed mast and lots of wire. Trees seldom reach 30 to 40 feet in height and are always in the wrong location! The greatest density of US stations from my location lie between azimuths of 360 to 120 degrees with another concentration between 270 and 315 degrees. All stations are at distances of less than 3000 km from my operating site. I will be operating cw from local noon until sundown throughout this summer at 5 watts output. I expect temperatures to be over 90 degrees Fahrenheit and I will carry shade and a large volume of water/Gatorade, needless to say I do not intend to hike too far! Oh what to do?

Date: 2010-06-15 20:45:43 UTC
From: n0hnj
Topic: 4234 Message: 4234

Hello to the group! Just joined, and my call is KB3MOW - the Yahoo ID is left over from my old call!

I have the AT200Pro Autotuner and have been very happy with it except for one problem. It doesn't seem to bypass as the manual states.

To quote the manual, pressing the "Tune" button for 1/2 second places the unit in bypasss, and RF goes directly to the antenna with no matching. Except that it doesn't do that with my unit. It still attempts to tune.

I emailed LDG about this, and they answered that the AT200Pro does not have a bypass feature.

Does anyone know if this is a typo in the manual, is there really no bypass feature, or is there another command to access it?

Thanks!
Dave

haven't owned the 200pro. But I did own the 100pro and several Z11Pro's. None of them worked/work in bypass mode,they all continued to tune if left in AUTO mode.If I remember right,the tuner needs to be put in "semi-auto" mode for bypass to work,but not sure as I haven't used my LDG auto tuners for quite some time;switched to a manual tuner

Dave,

All LDG tuners can be bypassed. However, if the tuner has an Auto mode and it's turned on, the Auto mode will override a bypassed condition and tune if the SWR is above the threshold level.

If you do not want the tuner to tune, you can simply change the Auto mode to off.

Thanks! That solves the problem. I leave it in Auto mode.

Help appreciated!

I have the new 600 watt auto tuner on order. Via cable, it links up with Yaesu and Icom. Can it be linked with my Elecraft K3? Or, any future plans to do so?

That is what I found out too in my mobile installation, hence the
tuner stays "in the box" unused since return from a factory check in
which they could not simulate the problems I was having with
exceptionally high SWR on an antenna & coax combination that tests
1.3:1 at best on 10M..!

May need a tuner when I get General license & more antennas, but
until then, it stays home in the box, as I get better results WITHOUT
the AT-200Pro which was recommended by the store I bought the equipment from

Hi Phil,

I would suggest that you contact the place that you ordered it from and cancel your order. Since nothing has been shipped to you, there should not be a restocking fee.

The Elecraft market is very small compared to the rest of the HF market. Yes, it is big for the kit market, but still very little in caparison to the entire HF radio market.

Most of the big manufacturers sell more of one radio model than all of the Elecraft radios ever sold (combining all models).

4245. RE: [LDG-auto-tuners] Re: LDG 600

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-06-16 19:22:17 UTC
From: Paul Brown
Topic: 4239 Message: 4245

I can only guess why LDG has decided not to provide a cable and the engineering that goes into making it work with Elecraft, but since many of my friends have sold their Elecrafts after having them less than a year or so, this might be the reason. Also, my understanding is that Elecraft management is almost impossible to deal with, and may have made some royalty or other demands on LDG. I sold my K3 after 6 months due to failures of numerous parts and the fact that my Icom 7200 has a better DSP and receiver overall, at less than have the price. I don't think Elecraft is a bad company or builds out a bad product, it is just plain over rated.

I'll give you $300 for the tuner.

OR perhaps sell it on this reflector for 50 bucks less, shipped. 300.00

Still think you should consider contacting Elecraft. They have over 5000 + users for the K2 and K3.

Why sell it?

Why don't use it in AUTO?

I am sorry but your question is not valid.

One thing is good for sure... The most popular radios have an interface, perhaps because the radio manufacturers made that interface easy?!

Having that said:

LDG Tunners will handle the power as announced.

If you leave it in "AUTO", use your Elecraft in low power (5W to 20W) in your favourite frequencies/bands and TX in CW.

Even if it will take some time (the max that I saw was 15 seconds) to make a proper tune, your radio will be OK.

Next time you TX full power on that frequencies/bands (or the vicinities) the tuner will choose the right match from memories in less than 0,5 seconds.

Isn't this good for you? Why so peaky for a great product? Does other well known brands have that Elecraft interface with the same quality-support-efficiency/price ratio?

LDG tuners speak for themselves. No need for me to take a position regarding LDG, I am only talking in being practical.

I own 2 LDG tuners. They work under water if needed.

Hi Phil,

We've communicated with Elecraft in the past and it just didn't work out. That is all we will say about it, it was neither positive nor negative.

The kits they make are great and fill a need that no one else can even come close to today. I personally don't have any of their gear, but if I were going to built an HF radio kit, they would be my #1 choice.

In comparison, the FT-817 had sold over 175,000 units by around the first part of 2008. Not real sure what the total is at now, but you get the picture of the differences in the market numbers.

I can only guess why LDG has decided not to provide a cable and the engineering that goes into making it work with Elecraft, but since many of my friends have sold their Elecrafts after having them less than a year or so, this might be the reason. Also, my understanding is that Elecraft

management is almost impossible to deal with, and may have made some royalty or other demands on LDG. I sold my K3 after 6 months due to failures of numerous parts and the fact that my Icom 7200 has a better DSP and receiver overall, at less than have the price. I don't think Elecraft is a bad company or builds out a bad product, it is just plain over rated.

I'll give you $300 for the tuner.

I would be glad to share my experences with the LDG Tuners I have.
LDG Z-817, Z-11Pro, AT-1000, Z-100, RT-11, AT-11MP.
I have used these tuners in all types of situations, Backpacking, Mobile, Camping, and at home.
My call is N8ZEE and I am in QRZed.
Feel free to e-mail me with any questions and I will be glad to share my experences with you.
Long wires, whips, di-poles, verticles, I have played with them all.

Bill

4254. YT-100 and the FT-847?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-06-17 16:55:12 UTC
From: ANDY - N1ORK
Topic: 4254 Message: 4254

Just got the YT-100 and it works great with my FT-857D. Since this has a through port for CAT and TUNE, I was wondering if it could work with the FT-847? Right now, I use the FC20 ATU with my FT-847 and with that in use, I can't do CAT control for logging, etc. The CAT/Tune ports use the same mini-DIN connectors, so was wondering if anyone at LDG may have some insight on this before I try to do this. I guess the only issue would be the radio control codes and the pin-outs. I think these are the same for both radios. I use the same logger control settings for both radios and my N3FJP ACLog program.
Any help/ideas are appreciated.

Hi Andy,

Sorry, Yaesu makes it somewhat difficult to interface with tuners. The 857 and 897 are the same, but the 847 is different. The FT-100 is close to the 857/897 so it works similarly. Even the newer 450/950 is different again than any of the above.

You pretty much need to have a different tuner for every other Yaesu radio. Then add in the connectors are different for some models and it becomes worse.

Since the FT-847 is discontinued, we have not looked at making a tuner just for it. However, there are a lot of 847s out there, so it may be something that we look at in the future.

From: ANDY - N1ORK
Topic: 4254 Message: 4256

Thanks for the reply Dwayne. It would be great if LDG could come up with a new or modified tuner for the 847. The FC20 works ok, but you can't do CAT and Tune at the same time. So a concept like the YT-100 would be great. I sure would get one, because now I have to go to the band, tune, disconnect the FC20, connect CAT, etc...

I am thinking of the Z100+ tuner for my portable / mobile FT-857D and size wise it will fit on top. For versatility, considering installing the battery tray, will this allow me to use either source for portable / mobile operating or will the installation of the battery tray limit to battery supply option only. Is the battery tray included or sourced from where?) together with the Yaesu cable in the box? Thanks for the help.

Just a final follow up. We shipped all the current AT-600Pro orders this week. US dealers should have them on their shelves later this week.

The new cables (longer Icom cable and new Alinco cable) are still on schedule for the first week of July.

Dwayne

What about an alternative case for the AT897?

I'm thinking cylindrical metal housing,(just big enough to take the PCB) with a 2" mounting collar and enclosed SO-239 on the base to sit atop a mast.

On the top a 3/8th UNF antenna mount. Around the lower edge, spaced at 120 degs and angled down at 45 degs, three 3/8th UNF grounded sockets.

Add four 102" whips and you have an all band tuneable groundplane for not a lot of effort.

Keep it under two hundred quid by the time it gets to the UK and you'll sell loads of them.

Failing that, what about a "PCB897" (ie no case) at a good price so people can make their own?

Just thinking out loud.

Kav

If I could request one improvement to the AT200Pro, it would be the addition of an LED that indicated which antenna is currently selected. I love being able to use either of two antennas, but admit it drives me a little crazy when I have the "wrong" one selected for the band I'm using! Other than that I'm very happy with this unit!

Subject: [LDG-auto-tuners] Blue Sky

If I could request one improvement to the AT200Pro, it would be the addition of an LED that indicated which antenna is currently selected. I love being able to use either of two antennas, but admit it drives me a little crazy when I have the "wrong" one selected for the band I'm using! Other than that I'm very happy with this unit!

Thanks for all the feedback. We'll put it on the list of things to look at. It would have to be a complete redesign since there are no I/O pins left in the current system, so it won't be anytime soon.

Hello Kay,

We've been looking at several alternative housing options for several tuners. The circular one sounds interesting.

I don't think you can get below about 10 MHz with a 102" whip with any of our current designs. You'd have to change over to a design like the AH-4 or SGC unit to get all band coverage. Of course, those units cost a lot more and are somewhat larger.

Dwayne

I've got a couple of SGC's but the box I use mobile at the minute is your RT11 (darn shame you binned that one!!!!!)

It's so long since I used a 102"er with it that I can't remember how low it went.

The thing is they'll still be ideal for the radials and you can put anything mechanically viable on the top. Maybe a whip atop a Hustler mast section or 12ft of lightweight military whip?

The tuning range and elements are almost imaterial coz thats where we would experiment, its the housing that is problematic to find without a tame engineering shop (got one) and plenty money (got NONE)!

Regards

Kav

Hi Kav,

Yes, that would probably work well with something like a Hamstick or Resonator.

Roland,

Thanks for the reminder. I had not updated the Software Version list in a while. Nothing has changed except some of the models are now in the discontinued section.

You can click on the link on the LDG Yahoo group main page or go through the LDG web site stating at Support/Manuals on the left side.

Would someone be able to offer me some advice please? If I was to solder in a battery tray into a Z-100 plus for portable work, would this limit the ATU to permanently working off battery power only once 'in' or would I still have the option of using the psu power without batteries installed, would the psu power override the batteries if connected via psu? Could anyone here in the UK advise where in the UK I can source a 6 in a row AA tray holder. No shortage of 3x2 doubles but can't find a 6 x 1 flat. I've tried the usual UK elecs sources. Thanks.

Just a small idea... Instead of using the battery case on the inside, the same battery case could be connected via the rear plug and that way you will not have to mess with soldering on the inside and still be able to choose what power source to use.

The greatest "update" was if the LDG tuners were able to charge the batteries on the inside if needed via 13.8V power source like our PSU and when charged bypass the power to the batteries and just feed the tuner itself, meaning that you could use/charge rechargeable batteries AND the use the bench psu from the same rear power plug.

4284. YT-100/FT-100/Fldigi

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-06-29 20:01:15 UTC
From: hl31943
Topic: 4284 Message: 4284

I recently purchased a YT-100 and am pleased with its ability to match almost anything posing as an antenna. It got a real workout at Field Day.

I did notice a problem when running Fldigi. When I would change bands and force the YT-100 to enter a complete tune cycle, there would be a long delay before anything happened. Often, I would have to close out Fldigi to get it to tune. I understand that the YT-100 and FT-100 share the CAT line and the tuner waits until the rig is through talking with the computer, but this delay would go a couple of minutes sometimes. When using the rig for voice, I haven't noticed any delay.

Anything I might have overlooked? I'm running Vista with a Prolific serial-to-USB cable and Fldigi works great with the rig.

For those of you that use a LDG tuner with a LDG tuner I found a way to make the tune button on the LDG tuner to key the FT-2000. I made a cable using a 1/8 in phone plug and a RCA plug on the other end. wire the tip and ground on the 1/8 in plug to a RCA plug use the TX REQ jack on the radio and the plug the 1/8 in plug into the tuner, set menu 147 tune power to 10 or 20 watts then you can use the tune button on the tune to key your FT-2000 works just like the FT-8x7 radios. Keys the radio in CW and puts out 10 or 20 watts until a match is found then unkeys the radio. Works great.

You have the radio set on "external tuner"? I believe that is menu item 110.

Set on external, I would expect the power to reduce automatically.

Have you tried the procedure on a really nonresonant antenna? 30M on a G5RV comes to mind.

Thanks,

AB6OR - Bill

4292. DTS-4 antennas switch available...

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-07-07 21:30:59 UTC
From: Petr
Topic: 4292 Message: 4292

Hello friends,

if You are looking for remote controlled antenna switch then there is
the secret sources for the 4-positions antenna switch DTS-4 from LDG. (discontinued long time ago)

DTS-4R (remote control unit)
http://www.cheapham.com/LDG.html

DTS-4(S) (antenna switch unit)
http://www.elix-shop.cz/store/goodsdetail.asp?strGoodsID=66246

I ordered both units 2 weeks ago and it arrived today.

If You will need assistance/help with ordering the DTS-4 unit as it is
Czech site then let me know.

73 - Petr, OK1RP

4303. Z-100Plus & IC706mk2g no go using ICOM tune button.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-07-22 02:34:11 UTC
From: ldevriesau
Topic: 4303 Message: 4303

Hi all,
I recently purchased a LDG Z-100Plus to use on my IC706mk2g.
Unfortunately it doesn't go using the Icom's tune button.
The tuner works OK using PTT and the LDG start button!

Using the Icom button, I get the a beep (press detected by CPU), but nothing else happens.

The voltages on the START & PTT connector is 4.4V & 4.8 V respectively whether the tuner is connected or not. They do not vary when the Tune button is pressed on the Icom.

I haven't done any substitution tests using another LDG Z100+ or IC706 mk2g as yet.

Any ideas?

Lee VK3PK

If you go to the options menu (LOCK+POWER ON) item 28 and set PTT tune
to ON, will it tune when you key the mike?

Just thought of something else. The TUNE button is a multifunction
key. The manual says to press the button for 2 seconds to make the
autotuner manually tune. Are you holding it on long enough?

From: ldevriesau
Topic: 4303 Message: 4306

Thanks for ideas. I had tried everything including your suggestions, but nothing really helped. However, I have it working now.
I pulled out the circuit of the 706 & I reverse designed the LDG signaling interface and found that there must be an open circuit somewhere as Kirchoff's voltage law did not seem to apply.
Sure enough, the multi strip connector on the PA board(bottom connector) did not seem to be seated properly. I had done some work on the PA board some years ago and it only seemed to affect the Tuner
wiring & was not an issue until I got the LDG.

It now works like a treat! Thanks

Hi,
I have a AT-100Pro (2004 V1.6L PCB and it says 100M1.1 on the long chip on the main PCB). This has laid unused for quite a number of years. It appears to work manually by updown the L and C switches, but totally unresponsive on Auto. I have even tried resetting the unit. The unit appears to give a double flash of the top display, if activated. I am sure I am going into Auto mode

I have a AT-11 (Built from the QST article). This unit appears not to tune Auto either.This has also laid unused for several years.

I have checked, and improved the grounding in the shack.

I have a 25-30 foot wire antenna, end fed on 30m.
A manual tuner works ok.

Any ideas? Chips ?

Thanks

Kevin

Hi,
Yes RF on output in bypass, and can tune manually

Found out the forward detector diode was open/circuit.
I replaced it with a HP 5082-2800 as a temporary fix.
It seems to work on a test bench and looks ok on the air now.

Will have a look at the AT-11 now

My 897 died and LDG replaced it with the Plus. I liked the 897 better as it did not use the CAT port and worked better with Ham Radio Delux. With the Plus and HRD you cannot tune correctly within HRD. Some kind of conflict with HRD and the LDG CAT components?. I love LDG and have 6 of their tuners but they are not interested in solving this problem with the 897 plus. Seems strange considering how many people use HRD.

Hi Craig,

We don't touch the CAT port when the tuner is not tuning. It just goes in one connector and out the other. So if it's not working with whatever software you are using, there could a cable or plug problem someplace.

Maybe you could be more specific on what kind of issue you are having.

Hello Jan,

You should be able to find the connection information on the specification page on our web site. Here is the link:

http://www.ldgelectronics.com/c/252/products/4/18/2

We don't know of anyone that has stand alone software to control the switch. But all of the serial commands are listed in the manual.

Hi Jan,

When you read the docs take into account that format is an ASCII char paired with a Hex byte into a string sent as a single word at 2400 8N1 with no handshaking and no CR or LF.

Here are some examples of C++ code to buffer the two bytes and send the word via the common antenna switch handler in MARS-ALE where several types of antenna switching are supported, if you were writing just to send to the DTS switch your string could just be sent directly to the comport handler:

```
// Send command string for DTS ANT SW port 1
buffer[0] = 'R';
buffer[1] = 0x02;

ant_send_command(buffer,2);

// Send command string for DTS ANT SW port 2
buffer[0] = 'R';
buffer[1] = 0x03;

ant_send_command(buffer,2);
```

Here is a link to an interface that you will require:

http://www.n2ckh.com/MARS_ALE_FORUM/LDG_DTS4_DTS6.pdf

For a ready made version of the above interface see the end of the above document for contact info on
KC2CNB who has been manufacturing them for the last four years for MARS members and others interested. I do not know if he will be willing to ship overseas, but it won't hurt to ask if you don't want to roll your own.

/s/ Steve, N2CKH

Hi Jan,

I see you have had some responses already and here is mine! I have used RealTerm to control the LDG switches, here is a message I archived for future reference:

Under the Display tab I select the Third button down, Hex[space], and select 'Half Duplex'.

Under the Send tab I have a change from the previous method that seems to work as well or better:

Select 'Strip Spaces'

To send a command to the antenna switch, enter $52, then a space, then $xx where xx is the command number. For example to select antenna 3, enter '$52 $04' (without the quotes). Then press the Send Numbers button to the right of the text entry area. That works fine here and I've tried most of the commands.

Hopefully you can embed such strings in your rig control software's Macro Key support, that is what a friend of mine did. I have not tried it yet with HRD, but I know it is possible. Those LDG switches are great!

There is s/w that can control the DTS-4 or DTS-6 coax switch in the N3ZH_Software yahoo group - in the files section.

The s/w does many many things - and among them is controlling the LDG switch.

Hi Howard,

I have a brand-new DTS-6 I bought from W4RT a few months ago. Never connected or used - I might get to it some day when I have more time. I paid $111 delivered. If you can't find one elsewhere I would be willing to sell it for what I paid, $111 delivered. (assuming you live int the USA!)

4321. IT-100 remote indicators

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-08-18 00:24:37 UTC
From: Mort
Topic: 4321 Message: 4321

My intended application for the IT-100 will be with an Icom 706MKIIG in mobile installation. The radio is in the trunk and the tuner will be there as well. In this arrangement, the tuning status will not be visible. Since the 6 pin DIN has two unused pins, 2 & 3 I plan to carry out the tuning status of each LED through these pins, an isolation buffer and have a remote indicator next to the 706 head.

I have some ideas how to accomplish this task. One is simple using a suitable buffer to protect the IT-100 and wires from the trunk to the 706 head. The ohter approach is more complex and uses an inexpensive wireless. The 'load' sensing the status of LDG LEDs will be 2 - 5 uA.

Has anyone ever attempted such a task?

Thank you.

Just wondering.

Is LDG going to manufacture more DTS-6 coax switches?
Or something similar to it?

I consider it an excellent low cost switch, and recommend it to all who ask.

The only improvements I would suggest is that it use a standard ICOM CI-V adapter rather than having to go to Holland Electronics(or use plain RS232) to hook it up to a computer, and to make the protocol be all ascii characters (no binary data).

Howard

Hi Howard,

You may still be able to get them from www.cheapham.com in NJ.

I too would really like to see the DTS units remain on the LDG product line up after the current production supply is exhausted. They are very popular with MARS-ALE users. Long ago when first asked Dwayne about the serial port parameters when I first added support for the DTS line to MARS-ALE, I asked about the prospect of offering a model that supported the ICOM C-IV interface and CSMA protocol due to the lack of serial ports in PC's, but now with USB ports, I would prefer a DTS like device with a USB interface.

An approach for CIV support would be an MCU CIV emulation, say PIC based etc., that implemented the CIV interface and CSMA protocol required and also knew how to command and control the DTSx interface. Writing such code to emulate an ICOM radio device is not too difficult, I just did so in emulating an IC746PRO in whole to allow MARS-ALE to look like an ICOM radio to any CAT capable program and do so for an antenna switch would only require the radio address code and the antenna port selection code.

You never know what the future will bring, but in this market it really depends on the demand and how fast a product sells to the market to justify tying up funds in a production run and inventory, perhaps LDG will bring back the DTSx series or perhaps something even better?

Hi Howard,

LDG has no plans at this time to bring back the DTS series. Those were discontinued a couple of years ago and although there has been some pockets of interest, we don't feel there is a large enough market to justify bring it back.

However, if we did, your suggestions would make for some great changes.

You have the necessary indicators on the radio.

If tune is successful the tune indicator on the radio will lite. SWR and power out indicators on the radio will tell you things are working ok.

Even though my tuner is near my radio, I find very little need to look at the LEDs on it unless I am experimenting with a new antenna. The tuner just works every time and to confirm this I see the tune indicator lite up on the radio..

Larry,

We have not tried to replace the bulb with an LED, but you probably could. It would most likely not be as bright, but it would last significantly longer. I would use a bright white and a 1K, 1/4 watt resistor in series.

The bulb is pretty much a standard small bulb with about 100 mA current draw at 12 volts. You'll get less brightness from an LED since it will only draw about 15 mA.

Wonder why LDG doesn't make a tuner more mobile friendly, such as
with a _remote head_ so mobile operators can see the LED's..?

My AT-200Pro is virtually useless in mobile use, unless one pulls
over in a parking lot to tune the antenna in use if a change is
necessary, as due to restricted "under-dash" space, the tuner sits
under the glove box & only a passenger (If one has a passenger), has
clear view of the tuner as it goes through it's process..!

I've simply tuned my antennas the OLD fashioned way with an SWR
bridge at time of installation & use an antenna selection switch to
choose the correct antenna for the band being used..

If anyone wants an AT-200Pro, mine is for trade or sale, as I have
not re-installed it since LDG serviced it last spring after having
high SWR issues the tuner apparently could not handle.. (Will trade
for a much smaller tuner that does not occupy several ft. of knee
space under the dash, OR $ 160.00 cash + shipping.)

Now use an old Heathkit SWR/power meter to monitor performance (Quite
large analog display, on top of dash, rather than blinking LED's that
are out of field of vision) & could not be more happy with my Yaesu
FT-857D & 4 tuned single band antennas....

Larry,

We have not tried to replace the bulb with an LED, but you probably could. It would most likely not
be as bright, but it would last significantly longer. I would use a bright white and a 1K, 1/4 watt
resistor in series.

The bulb is pretty much a standard small bulb with about 100 mA current draw at 12 volts. You'll get
less brightness from an LED since it will only draw about 15 mA.

I hate to pay $10 for a bulb. I tried to take a voltage measurement and it reads 0vdc? Maybe I have
other problems. It seems to tune alright. I'm just learning about it.

For Sale: Icom 706Mk2G

A very nice, clean 'Mk2G, serial #021xxx. This radio has the optional narrow SSB filter (FL-223) and the optional carrying handle (MB-72) installed. It also has the HM-118TN microphone with tones. When I got this rig I took it to our local tech who went through it and made certain that everything was operating correctly and within specs. He also did the 60-meter mod. This is really a great radio and has seen almost no use since I've had it.

The price is $725, double boxed and shipped to your door (in the lower 48) via UPS ground. Pictures are available upon request, questions are welcomed.

Also For Sale: LDG Z-11 Pro Antenna Tuner

A very clean Z-11 Pro tuner. The box is marked "blemished" and the only flaw that I can find is one small chip on the corner of the cover, just above the upper-left corner of the front panel. This tuner works just great and is a terrific partner for the '706. It's small, fast and easy to work with. I bought this tuner new and it too has seen almost no use.

The price is $125, double boxed and shipped to your door (in the lower 48) via UPS ground. Pictures are available upon request, questions are welcomed.

Buy both for $825, again double boxed and delivered in the lower 48 via UPS ground.

If you have any questions or want to make an offer, please contact me off-list @ bpariza at yahoo.com.

Thanks, Bob

Hi Larry,

Yes the light should come on when the tuner is powered on by the on/off switch.

I have an older Z100 with a ver 1.0 firmware. is there any way to upgrade this unit to newer firmware?

It seems to still work OK. Been a while since I used it since I have had the rig in the car .

4340. YT-450 vs Z11 Pro ?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-08-22 19:58:21 UTC
From: CharlesC
Topic: 4340 Message: 4340

I just saw an ad for the LDG YT-450. Since I have an FT-450 and a Z-11 Pro, I have to ask:

The Z11 Pro works fine with my FT-450 -- it sits in the attic, with AA batteries powering it for a year or so.

What benefit would I get from switching to the YT-450? Wider tuning range? Lower losses?

Thanks --

Charles VA7CPC

Topic: 4340 Message: 4341

Hi Charles,

From what you write, you have your tuner remotely located where power is not readily available.

The Z11 Pro is an excellent tuner that is very versatile. (I have two of them) Being able to run on batteries and tune with RF sense and makes it do what you want. So, in your setup, you would gain nothing with a YT-450.

The YT-450 is designed to be powered from the radio, not batteries. There is no mention in the manual, that I saw, of an RF sense ability to use it separate from the radio, without CAT. To use this tuner remotely, you would have to run power and CAT cables to the tuner in addition to your coax.

From the YT-450 manual..
http://www.ldgelectronics.com/assets/manuals/YT450ManualRevA.pdf

"The T-450 is similar to previous LDG tuners,but is specially engineered to integrate with your Yaesu FT-450 or FT-950 HF radio. The YT-450 connects to the CAT (Computer Automated Transceiver) port on the back of the radio. The CAT interface allows an external device such as a PC or the YT-450 to control the FT-450/950 by sending it serial commands. The YT-450 takes advantage of this interface to simplify the tuning process -- one button push is all that is needed in order to switch the radio to AM mode, reduce output power, transmit a carrier, measure the transmit frequency,and then restore the radio to its previous mode and power level! Additionally, the YT-450 also draws power directly from the radio, so no extra cable is needed."

4350. Modification to AT-600 Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-08-31 17:01:18 UTC
From: ltw_1937
Topic: 4350 Message: 4350

I have a AT-600 Pro and am well satisfied with it. I want to start using it with MARS ALE. When I have the transmit set up with low SWR on a frequency, some of the other frequencies in my receive scan are severely attenuated. To solve this problem, I need to be able to go to a bypass mode under computer command when receive scanning and then return to auto mode under compute command when ready to transmit.

The bottom line is I need a simple remote function of the tune button for momentarily closure.

NO I have not discussed with LDG and Yes I know I can do this with the discontinued PC control version of the tuner and would be interested in locating one of those.

Appreciate any help. Larry K4LLQ/ AAT3PY.

Topic: 4350 Message: 4351

Hello Larry,

The ring on the radio interface on the back should give you what you want. The ring mirrors the tune switch on the front panel. So if you ground that for about 0.5 seconds (or less), it will put the tuner in bypass.

Then once comms are established, you can tune at the desired freq.

The 200PC have been discontinued, but there are plenty available. Try www.cheapham.com for about $160.

Hi Larry,

I know things are heating up in Army MARS with
ALE and many are just getting started. The support forum for MARS-ALE is:

http://groups.yahoo.com/group/MARS-ALE/

Although the AT200PC would be a much better
choice for ALE as it was designed with ALE in
mind, you can control any of the PRO series
tuners for BYPASS when needed in MARS-ALE where
upon the next TX state the tuner will automatically exit BYPASS.

You must first be sure that the tuner has been
trained for the frequencies being used and that
your antenna is relatively stable in all WX
conditions as there is little margin for
elongated re-tuning cycles with the PRO tuners
whereas with the AT-200PC the tuner is preset to
the last know state for frequency from memory by
MARS-ALE before any RF which shortens any needed
re-tuning if the antenna system characteristics
vary. I also recommend using a value of 1..3 in
ATU Tune Words to generate a short, low RF tune
tone prior to ALE data being sent.

You need to select ATU Type LDG PRO and enter the
serial port for ATU com port. You do not need to
enter the value for DTR BYPASS as its preset by selecting LDG PRO.

If for some reason you have timing issues then
select RS232 LINES for ATU Type and play with
entering values for DTR BYPASS in milliseconds.

Lastly you need to specify for each channel the
ATU will be active using either CHANNEL ADD or
CHANNEL MODIFY by checking ATU Enable or not.

Here is a simple circuit for PRO model
interfacing, many approaches can be taken but this one is pretty simple:

http://www.n2ckh.com/MARS_ALE_FORUM/ldg_radio_port_DTR_reed_relay_circuit.jpg

Here are docs on using the DTSx switches if you
also want to switch between NVIS and Skywave antenna.

http://www.n2ckh.com/MARS_ALE_FORUM/LDG_DTS4_DTS6.pdf

Here are the docs on using the AT200PC, the preferred choice in my book.

http://www.n2ckh.com/MARS_ALE_FORUM/AT200PC.pdf

4354. Help needed...RF getting into tuner

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-09-01 22:37:04 UTC
From: andrewthall
Topic: 4354 Message: 4354

I am running an IC-7000 into an AT-200Pro in my truck. On 40 meters, after I get the tuner to tune up, my RF wakes up the tuner and it starts going crazy. The antenna is a Texas Bug Catcher. I never experienced this problem when I was running a Kenwood TS-480 with its built-in tuner.

Any help would be greatly appreciated.

Sounds exactly like what I experienced with my AT-200Pro with a Yaesu FT-857D, but with a different make of antenna, sent the tuner in to factory after many trials with new coax & different antennas, LDG could not re-create my complaint at the factory, but AT-200Pro was returned with a replaced diode (IIRC)..

Is your coax dated..?

I changed coax from RG-58 to RG-8x, ran it straight to a proven & previously used antenna & get SWR of 1.2:1 without the tuner (But with an old Heath SWR/Power bridge in-line) on 6 & 10 meters.. The tuner is still in the box, haven't found any need for it.. Antenna Hustler Resonator long mast on spring with 10m resonator (Mast is resonant on 6 M)...

Made several QSO's on recent 10-10 Summer QSO Party while mobile.

Topic: 4354 Message: 4356

I had a problem with RF in the outside shack. Fixed, not mobile!
I bonded everything together with short leads. Made sure the PSU negative was grounded to the chassis. Used ferrites on the supply cables. And ran a local earth.
Problem solved. Can use the PC simulataneously with RF out

With a mobile, depending on placement of seperate units, the earth bonding may not be good. There may be RF on the outside of the coax say between the Rig and ATU, so ferrites may help. And check local bonding of units to chassis.

Good luck

Kevin

Just a quick update to this. We have most of the requests processed and the first chips should be arriving shortly.

Be sure to down load the new manual from the web site as some of the functions have changed.

4366. RT-11 continued...

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-09-13 19:05:47 UTC
From: Jacob Tennant
Topic: 4366 Message: 4366

I have also found that if I try to tune a antenna I get different results everytime I try to tune it.

For example, I have a dipole hand tuned with a MFJ analyzer for 1:1 @ 7.300Mhz also shows 1:1 on my FT-450. When I hook the RT-11 inline it can only tune the dipole to 2:1 at best.

Each additional tuning cycle produces a different swr reading but never get a 1:1 reading that should be there very easy.

Could the chip be outdated or bad? What was the last or latest version firmware?

I looked inside the case and nothing appears to be bad or burnt.

4367. IT-100 and Tuning indicator on Icom 7000

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-09-13 18:49:58 UTC
From: robertlstarr
Topic: 4367 Message: 4367

Hi All, I have an IT-100 tuner that works great with both my Icom 706mkiig and my Icom 7000 with one difference. When tuning out of the "Tuned" frequency range or band, the Icom 706mkiig must (I assume) send a signal to the IT-100 that drops the tuner out of the antenna circuit automatically. The 706mkiig tuner light goes off and the IT-100 Tuning red lights blinks as it goes off-line. This happens each time the 706mkiig is tuned out of the previously tuned band.

The Icom 7000 never (again assumed) sends a signal that the transceiver has been tuned out of range unless the 7000 is switched to VHF or UHF frequencies. Only then will the IT-100 acknowledge the frequency is out-of-range and drop the IT-100 out of the antenna circuit. I am aware that this behavior is described in the IT-100 manual but the 706mkiig seems to be more advanced in dropping the tuner out when out of a previously tuned range!

Is this normal?

Thanks for any help or suggestions!

Bob

I have found that tuners do funny things when you try to tune into a good SWR or less than 1.2to1. You do not need the tuner with that low SWR just bypass it and go on.

I understand that with a antenna with a 1:1 SWR a tuner is not needed, it was just a reference as to what appears to be the problems I am having with my tuner as a 1:1 SWR antenna should be simple for the tuner to match up but it takes a full 8 to 10 seconds before the tuner stops tuning and even then it takes a 1:1 SWR tuned antenna and turns it into a antenna that is not 1:1SWR.

The other reason for this demostration is that it seems that the tuner is not reading the antenna properly as I also have a YT-100 for my FT-857D. I connected the FT-857D/YT-100 to a simple 10 meter dipole that I had check and knew it to be about a 4:1 SWR at 28.400Mhz. The YT-100 matched it down to 1:1 SWR in just a few seconds. The RT-11 with my FT-450 tuning the same way as the FT-857D package (10 watts in AM) never got the same antenna at the same frequency to tune any better that the 2:1 SWR I started out with. I tried 5 tuning cycles with the RT-11 and got 5 different SWR levels.

Could this be a problem with the processor chip or something else?

I also noticed that the RT-11 will not tune antennas that are above approx. 3:1 SWR unlike my YT-100 which has tuned antennas of up to 9:1 SWR and got them down to a useable level with only one tuning cycle.

Just trying to figure out if this RT-11 is a lost cause of is it worth sending out for repair as I only have $75.00 invested in it so far, not counting the remote head for $25.00 from W4RT.COM

Jacob:

It may be that you have a problem with your RT-11. If so, it's most likely relays. Burned relay contacts could certainly make the unit erratic. If you bought it used (it seems that way) it could be that it was abused and then the person couldn't get it working correctly so they sold it. It's not that hard to replace the relays if that's what it is.

There's also an adjustment that needs to be set to (I believe) set reflected power balance or some such thing. I would think though that if that's a bit out of whack that you'd still get somewhat consistent readings.

Also, the tuner should be fine with a 1:1 load. It may not give you exactly the same reading after it tuned, but should be pretty close.

Chuck

Auto tuner that is trying to tune a 1:1 SWR will just go crazy and never find a match because there is no miss match for it to work on. It just keeps looking for one. I would check LDG web sight and see if they have a update chip for the RT-11.

To me, an SWR/Power meter is of better use in trouble shooting
problems, rather than trying to make an antenna tuner soothe out the issues..!

After LDG could not replicate problems I was having, I simply slipped
in an old Heathkit SWR/Power meter where the tuner once was, seems I
get better performance & a true metered SWR reading, rather than an
array of flashing lights that are next to impossible to monitor while driving..

Howard Bingham

PS: Anyone want an LDG-AT200Pro...? Will trade for any ham equipment
of value (Up to $ 200.00 worth), the tuner was LDG serviced & had
diode replaced, but is still in shipping box, has not been used since service.)

Howard:

You do realize that an SWR/Power meter does not do the same thing as a tuner, right?

You say you replaced a tuner with an SWR/Power meter and that was better. So you already had a tuned antenna then, right?

What we're talking about is a malfunctioning tuner. Not sure why replacing that with something that's not a tuner would help.

OK, after I got home from work and read Chucks reply I got brave and dis-assembled my RT-11 as best I could since my supply of tiny tools is limited.

Upon opening the case there is no smell of burnt electrical parts and no visible signs of any burn marks anywhere on the board that I can see on either side.

The main processor chip is marked RT 1.3A and I am assuming that is the version number and have a email out to LDG tech support to see if there is any newer versions available as I have a friend with a chip burner at his work site that said he could burn me a new one if I can just download the firmware instead of shipping out my chip and losing my auto-tuner for the time in shipping.

I did notice marked on the PCB for TP1 and TP2 with variable resistors beside them and was wondering where to find a schematic and or service manual for this unit as there is also a variable capacitor near the TP's.

Don't be alarmed as I am not going to try to tinker with this unit much without the help of my trusted ham electronics guru aka. retired professor of Aerospace Engineering and general go-to guy for all things electronic.

Any ideas???

Just for fun.. try tuning your dummy load..

One evening I forgot to switch from my dummy load to antenna and pressed the tune button on my IC-7000.. well my Z11pro sure didn't like it.. was not able to tune at all.. tried a bit then stopped and the tune indicator on the radio went out.

On my antenna I never have a problem.. it is not any where near 1:1 on any frequency.. The tuner works great, tuning my crappy wire from 160 -6 meters.. and it gets out amazingly good.

Well last night I got brave and pulled all of the chips out of my RT-11 and using contact cleaner and a q-tip to clean all of the contacts and it did make a big difference as now the tuner is functioning much better.

Still not tuning some bands on my 80 meter dipole but does much better than before.

Only thing ia it will not tune the dipole to a usable level on 40 meters.

Go figure...

My hat is off to the LDG team! I got my upgrade about 2 weeks from sending in the form.. all I can say is WOW! Super fast tuning.. I about fell out of my chair the first time I tryed to load an antenna! I thought I was smoking the tuner for those relays where just a going. I Love the PEP meter reading. Might be more upgrades I am have not found yet.

Each day I get off work, I cant wait to play with my radio and tuners..

ts-480hx to LDG pro200 to ameritron Al-811h to LDG 1000 pro..
antenneas.. A3WS, A4S, Hygain Hytower, 260 foot diple fed ladder line to 1:1 then coax to shack to tuners, 1/4 top loaded 160 meter sloper, A99, 4 element for 6 meters.. and 2 empty coax connections on remote coax switch to play with. Loads every thing.. even hook a alagator clip to neighbors 10 acre eletric fence he does not use anymore.

tnx and keep up the good work!

Tuning an 80 meter antenna to 40 meters would be a plus, but I would not expect it to happen. Your trying to tune a full wave dipole on 40 meters, that's a difficult thing to do.

Exactly what I have in mind for an AT-1000 (non-Pro) in the barn. Local power, with a twisted pair to key a relay to tune.

I can free up the AT-1000 since I just got a Pro for inside.

FWIW... have used LDG tuners from the QRP to Z100's (both kinds) and 1000's and Z100's. Nice work.

Cheers,

Hi Dwayne,
Got my chip on Friday and installed it last night.
The FAST tunning is amazing and the peak reading meter great.
However the meter/auto tune sensitivity seems reduced.
I realise that one is not really supposed to use a 1KW tuner with 5W of QRP. However I have been using a Flex 1500 at 5w to drive an amp to 350W and could tune on 5W with the linear off on the old chip. That way I could do QRP or QRO at the flick of a power swich.
Now it is intermittent on 160, 80 and 40m with nix above.

I did notice I had to use a little more rf to get it in the auto tune mode.. I was using 5 watts.. now 10 watts. One other thing I have notice after about a week of use, is sometimes when I power the tuner down.. I have to unplug to power cord in back to fire it back up agn.. I am checking to see I it is rf from pulling out of line and pack in.

Date: 2010-09-21 14:37:16 UTC
From: saukp
Topic: 4342 Message: 4386

I would like to add my thanks to the folks at LDG for the AT1000pro update and the quick delivery of the chip.

All for FREE.

I Finally got a chance to install the new chip and to me the tuning processes seems so much quicker, both in search to tune and in memory to tune mode. The memory mode is soooo much quicker than before that at first i thought it wasnt working

it was working just fine.

Also the peak function is nice...this has allowed me to adjust power
going from my orion to the FL-7000 amps while talking on ssb and keep
the power level constant coming from the amp...there is no alc feedaback between the orion and fl-7000 so this is a nice added feature for me.

Once again thanks for a great job and great customer service

Hello all,

We've added a two page application note on interfacing to LDG tuners. It's in the "Files" section of this group.

While it does not list every way to interface to the most of the generic LDG tuners, it is a good starting point for those that need more info on what is going on.

Well, I just took delivery on my Z-718 today for my FT-817ND and have been fooling around with it this afternoon.

Due to deed restrictions, I have to have a long wire in the attic. With my MFJ-902 "Travel Tuner," I can tune 80/40/30/20 without any problem. With the new tuner, I can't tune 80. Since the wire is "short," is it fair to assume that the LDG can't switch in enough inductance? I hate to have to run two tuners in series, and run one in bypass mode, just to get to tune 80 meters. Would a 4:1 balun likely do the trick, just run the output unbalance?

Well if I am having a problem with mine maybe there is something going on with mine. All I am looking for is some input as to what might be going on with this tuner. I already own one that works very well or I would not have purchased a second.OK back to the issue at hand, I have a fan dipole cut for 160/75 the tuner will not tune. I have been at the tutorials to no avail. Running a TS2000 have shut off internal tuner when trying to use LDG. Have spoken to tech support asked if I should use a balun answer is not needed.Any thoughts on this problem Thank you Martin N1KGP

Since the wire is "short," is it fair to assume that the LDG can't switch in enough inductance? I hate to have to run two tuners in series, and run one in bypass mode, just to get to tune 80 meters. Would a 4:1 balun likely do the trick, just run the output unbalance?
>
> /paul W3FIS
>

Often if a manual tuner doesn't have a problem and an auto tuner does,
the problem can be traced to RF getting into the tuner. While I don't
have a Z-718, I have used other LDG tuners to tune fairly short wires on
80 meters, so I don't think that's the problem.

Jim.

Jim,

That is very good advise.

Another thing to think about is a manual tuner will usually have a much, much wider tuning range than the typical autotuner. So check the antenna with no tuner in line to see what the SWR is and make sure it's within the tuning range of the tuner.

4395. Short antenna

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-10-02 20:11:24 UTC
From: W3FIS
Topic: 4395 Message: 4395

Due to deed restrictions, I'm stuck with a short end-fed "stealth" antenna about 15' long. With the Z-817, I can easily tune 40 meters up, but with the Z-817, cannot get a match on 80 meters. With my MFJ-902 "Travel Tuner," which is a "T" design, and clearly has more range, I can tune the antenna on 80 meters.

My perception is that the Z-817 doesn't throw enough inductance into the antenna to bring the resonance frequency down.

Would a 1:4 balun do the trick? LDG lists one (I do not need something for out-of-doors) that would would be fine.

What is the wisdom of the group?

BTW, the Z-817 nicely tunes this "short" wire on 6 meters.. New fields to explore on WSPRnet.

Nothing against LDG, but it seems my mobile rig (Yaesu FT-857D) runs
better with only an SWR bridge than with a tuner, to spite
recommendations that I get both by more seasoned hams.

May have something to due with the size & the LED's, as the only
place to put it in my pickup was under the glove box, as I have stick
shift & the heater & A/C controls are in the way for anything to be
mounted close enough to see..

IF ONLY there was a remote control head & real gauges instead of the
LED's which can be annoying to monitor while driving (As if there are
not already enough other distractions to worry about in heavy city traffic.

On the 857 there is a 1/8 inch connector just under the tuning knob for plugging in a meter. Instead of buying one of those marketed for the 857 I just got a sensitive meter at a flea market and shunted it with an adjustable resistor to set full scale SWR. I admit a cardboard meter box taped to the dash didn't look as good as a W4RT meter... (heh!)

HOWEVER:

Using an automatic tuner with a mobile antenna is a LOT safer than manually tuning an antenna with the aid of a meter while driving, even when there's one more or less in the driver's line of sight. With a Screwdriver or the like, one can first tune for best heard signal, than enter a tune cycle and know things won't be much worse than if he'd resonated the Screwdriver exactly. With a fixed coil (Hamstick or Hustler, etc) just stay within the band you've tuned the antenna for earlier, and hit the tune button. You don't need to look at SWR bars/LED's or meters.

Sounds fine & dandy, only with a very limited budget, and issues with low clearances, a screwdriver antenna is far from my budget (Unless I luck out on Texas LOTTO ;-))

Simply put, I use Hustler resonator antennas on a folding mast, in addition to dual band 2m/70cm antennas for a different radio, at last count have 4 antenna mounts on the back rail of pickup bed, only the dual band antenna fits carport & garages without problems, other antennas I either fold over or remove & only use as needed (Placing a cheap dummy in the crew in socket to prevent weather issues).

An SWR meter is better for my personal use & DO NOT like dedicated meters as that would necessitate additional expenses this retired dude can ill afford. Nothing like an OLD Heathkit SWR/Power meter that when I'm driving is front & center on dash, parking, the jumper cable just long enough to place on floor & out of sight.

As good as the LDG Autotuning tuners are, to me those blinking idiot lights are a ROYAL PAIN to be able to read while driving, that HEATHKIT tuner can be read by anyone with ease..!

Simplicity at it's best, OH, Multiple antenna switcher on floor is most often set for 6m/10m antenna, as it's used more often than not, the dual bander is a dedicated antanna on

a separate radio, no having to mess with the FT-857D programming issues, my OLD dual band Kenwood is computer programable, but most often have it set on just 2 rfrequently used repeaters.

The L-match autotuner is quite different from the MFJ T-match. You can make many loads "look" good with the T-match but a lot of power may be dissipated in the matching network.

The L-network won't allow that and so the range may seem less.

Why should that be? The major loss is going to be in the inductors. There will be minimal dielectric loss is the capacitors.

Any reflected power is loss in heating the output transistors, versus PERHAPS more loss in the inductor??

Frankly the non-optimal antenna is the real culprit, but I have deed restrictions, so a "stealth" antenna of magnet wire is required.

Anyways, I have worked Australia with one watt on WSPRnet... and regularly work the west coast PSK-31 with 5 watts, and Europe with 1 watt on JT65-HF...

I have been accused of powering things with flatulent butterflies and using a bent nail for an antenna...

I thought a little more about the topic. Let's consider an "L" tuner. Think of it as a "PI" tuner with once capacitor missing. You put the "missing" capacitor end where you get the best match. This is what LDG appears to do.

In matching a load (ANY LOAD), the "match" condition for maximum power transfer is to present the complex conjugate of the load impedance. That means:
Opposite "sign" of the reactive portion and of equivalent value. If you see an "L," you need a value of "C". If you see a "C" (the usual "short" antenna problem), you use an "L," the classic loading coil. Where the coil goes is another story.

Resistive part must be the same.

You can prove this with the calculus. Determine power transfer as a function of R and X, and determine the maximum value for power transfer. Freshman EE...

The first part is easy. Variable inductor or capacitor is all that is needed. However, the 2nd part is the hard part. If you look at a "Pi" network, the ground point is actually the "tap" on a capacitive voltage divider, the two capacitors in series and the inductor forming a resonant circuit.

If you do a "wye-delta" transformation (I'm an old electric power EE guy), instead of a voltage divider, you have a current divider and a "T" tuner. The problem is that you have three variables in a "T" or "Pi" tuner -- two capacitors and an inductor. You only have two things to match, so you have an "over deterimined" set of equations, so there is no UNIQUE match. With the "L" tuner, if you can get a match, you have the ONLY match value set (only 2 variable, not 3).

With three variables, you have potentially a much better range for a potential match.

The LDG Z-817 states that it is an "L" tuner, and swaps the C from one end to the other to attempt to get a match.

Interestingly enough in light of that bit of information, I took my MFJ-16010 tuner (L design) and fitted it with an SPDT toggle switch from Rat Shack to do just that. Avoids having to swap cables, which is a PITA.

Also, FWIIW, I recently picked up a nice CB antenna from Universal Radio for modification to 10 meters (took off about 6' of the whip). I wanted to fit a piece of Tygon tube as a chafe guard. In pulling the base apart, inside was a nice small base loading coil, and SMALL capacitor across the coax to ground! The "L" tuner incarnate!

The real question is which tuner has less loss? The "T," or the "L"? You would have to determine the current in the L for the condition of best match. Again, all things being equal, the higher loss will be with the inductor with the higher current.

Also, to further confuse things, core loss is a weird function of frequency, and should vary with the core material choice. Skin effects shouldn't be an issue until you get above maybe 10 MHz. I pulled apart my two MFJ tuners, and they use what looks like maybe #14

wire, which at the power levels I'm running, is more than satisfactory.

I recall when in grad school running a 5 KW AM station to pay my bills (WELI in New Haven), the sucker used really large rigid coax and I recall the coils in the Collins phasing rack being something like silver plated 3/8" copper tube, but that was a long time ago.

Once you get above 30 MHz, inductors behave less like inductors, and the whole game changes. The the turn-to-turn capacitance becomes important, and the leads on the capacitors have inductive components.

Those of us cursed with "short" antennas and deed restrictions need to read all the stuff about mobile HF antennas.

What have I missed???

With the T-match the three elements (two capacitors and inductor) can be adjusted so that the TX sees 50 ohms, but the efficiency is very poor and lots of power is dissipated in the inductor rather than being transferred to the load. Try it, get one tuned up for best SWR, then start changing the capacitor settings. You can make the TX happy with many combinations, but not all give the same output from the tuner to antenna.

I discovered this the hard way, tuning up a dipole on RTTY with a 300w MFJ-949E. The 100w out of my radio into a perfect match (as shown by adjusting the tuner) melted the inductor and it slid sideways in the box.

One of the published tricks to avoid that is to always use the least possible inductance when tuning the T-match.

Another is to change to LDG and Ten Tec L-match tuners :-)

Google is our friend.... here is what seems to be a reasonable discussion of the matter.

http://www.w8ji.com/antenna_tuners.htm

It gives a good idea why LDG has gone with an "L" design, especially if we are trying to "automate" the minimum SWR. There is going to a "unique" set of values for a match, if you can get one, with the range of L and C available.

Also, there is a pretty good article in the ARRL archives on how to tune with a "T" tuner. It does support the "minimum L" argument.

For a really "difficult" antenna, I'll keep my "T" tuner.

BTW, I have a 1:4 balun on order, and as my mechanical engineer friends say, "when in doubt, get a bigger hammer." I'll simply transform that out-of-range impedance into something the Z-817 can handle for 80 meters. Of course, there is loss in the balun... (more gasoline just thrown on the fire.....)

I note that the instructions from MFJ for the MFJ-902 suggest using the minimum inductance, which will obviously minimize losses, as the major one is the inductor. That is consistent with your comment.

However, you have not addressed why one design (T, Pi, or L) should be better than the other.

Ideally, you shouldn't have to use a tuner. However in the real world, you will need one. The issue is which one, given the constraints of space, deed restrictions, etc, etc, etc. There seems to be a lot of anecdotal discussion, but who has done some analysis on the issue?

That is a good site, and most enlightening. I need to pull the cover off of my Z-817 and see just how many inductors it has, in light of the fact that it is probably using a binary selection process.

Hello All,
With the new chip after a time the AT1000pro seems to lock up and become unresponsive to the front buttons.
Cycle the power at the supply and all is back to where it was and responsive again. Anyone with similar behaviour?

Topic: 4409 Message: 4421

Seems it works the same as my Z-817 for my FT-817ND, except it gets its power from the FT-450.

The Z-817 accesses the CAT/control port on the transceiver, reads system parameters, does its thing, and returns control to the transceiver.

Explain the internal/external deal??

Quite likely. My auto tuner (Z-817) is used with my FT-817ND, of course, and a Ft. Tuthill 80, and a Wilderness Radio NorCal 40A.

The Z-817 reduces the power on my FT-817ND to 2.5 watts for tuning.

Topic: 4423 Message: 4423

Got the 1:4 balun in the mail today. Hooked it up to my 32' wire in the attic. I can now tune nicely all the way from 80 meters through 10 meters with the Z-817ND. Hooked the balun up as a simple impedance step-up unbalanced transformer, as the manual suggests for "long wire" antennas.

As I suspected, the z-817 simply could not muster up enough inductance for the impedance presented by the "short" antenna.

BTW, I also pulled the back off at the suggestion of member of the group. A dab of hot melt craft glue (it appears to be polyethelene) took care of the "sticky tape" problem. Also gently tightened all screws/nuts, and ran a bead of silicon rubber seal around the edge of the case before putting it back together. If I want to run it out-of-doors, I don't need to be concerned about moisture.

As I said, when in doubt, get a bigger hammer. Check with SWR meter suggests I am getting 1.3:1 or better in all cases.

Problem solved!

Date: 2010-10-13 19:14:30 UTC
From: Ted Leonard
Topic: 4425 Message: 4425

I am using the Z-11Pro 2 tuner with my Flex 1500, I wanted to be able to use it remotly so installed the batterys, works fine except sometimes it hangs up with the 2 red LED's lit.
The only way to get it back is to remove power and that is a pain because you have to take the cover off and pull a cell out. Now I leave a cell out and just power it from my PS.
Much easier to reset this way, but it shouldn't be happening. When the 2 red LED's are lit it won't do anything until you remove power and power up again. Ideas??

There are no comparison charts that include discontinued products.

However, the 1000Pro added a larger meter, Auto mode, 4000 memories. The latest firmware has peak and average meter modes.

The tuning section in both units are nearly the same.

Hi Johnny,

No, I don't think that is possible as the AT-897Plus is looking for serial commands to and from the radio. If the serial data is not there on power up, it just flashes the Red LED for an error.

Johnny,

Yes, the Z-11Pro and the Z-100Plus are generic tuners and can be used with just about any 100 watt radio without an interface. Simply key the radio in a carrier mode and press the tune button on the tuner.

Thanks Dwayne,
Are either of the Molex Part Number 0003092041 or 0003092042 the correct plug for the IC7000?
Regards,
Lee

Hi Dwayne

juz to confirm that ?the flow chart you have uploaded is very informative and help prospective users of ldg tuners to take correct decision on selecting the right stuff for them. i had been using a z11pro along with my 857d and am very happy with its performance tuning everything i throw at it. hopes to upgrade soon when i change over to an amp in the future.

?

Hi Folks,

With so many LDG tuners these days (and more coming), we're trying to simplify the decision making process somewhat. We've recently updated the tuner comparison spec chart and now we'd like to try a Tuner Selection "Flow Chart".

I'll put it in the Files section of this group and anyone that has comments or feedback on how they think it will work can post to the group or directly to me.

Thanks for your help,

Dwayne Kincaid

Right on target! Thanks!

Slightly off topic, but in the next revision (this might apply to other LDG products), please include the "reset" procedure. In experimenting with my Z-817, and a variety of antenna configurations, I have needed to clear the memory on occasion.

Topic: 4428 Message: 4442

The latest firmware (in both?) has peak and average meter modes?

The auto mode in the Pro "automatically starts a tuning cycle when the SWR exceeds a limit you set." - but in the non-Pro the initial setting stays the same unless one manually initiates a re-tune - presumably when one observes a SWR change on the meter?

4,000 memories in the Pro whereas the newer firmware adds 200 to the non-Pro. (making a total of ?? memories in the non-Pro?)

The purpose of the memories is to make a return to settings faster and more quiet?

Thanks!

doc

Re: Compare & Contrast AT-1000 with the Pro?

Thu Oct 14, 2010 3:05 pm (PDT)

There are no comparison charts that include discontinued products.

However, the 1000Pro added a larger meter, Auto mode, 4000 memories.

The latest firmware has peak and average meter modes.

The tuning section in both units are nearly the same.

Paul,

We've pretty much taken out the memory clear function for all of our tuners. Since each memory is stored by frequency, just doing a full tune will throw away the old one and put the new one in it's place. We have not yet found a case where "all" of the memories needed to be cleared.

To Dwayne mostly...

Ok, you use a "replacement" algorithm for the Z-817 when it is attached to the FT-817ND. What about the "200 memories" when we use it for one of our QRP rigs? How does it know, or does it just do a quick search in the smaller memory???

Inquiring minds want to know...

Hi Paul,

Good question. We use a circular buffer for the 200 memories where the most recent match found is always first in the list. When more than 200 matches have been found, it throws away the oldest one, thereby keeping the most recent 200 matches stored.

During the development of that technique, we found that just 40 or 50 memories would work very well. But the processor has enough space for 200 memories and we put in as many as it would hold.

So again, no need to erase the memories as it saves a new one every time that it needs to and only throws away the oldest one.

Ok, classical "most recently used" argument. (sorry, I was a CS prof in an earlier life, among other things).

>

More is always better....
>
> So again, no need to erase the memories as it saves a new one every time that it needs to and only throws away the oldest one.

200 will be more than enough, as the CW portions of 80, 40, 30, and 20 meters are sufficiently narrow that much re-tuning doesn't seem necessary.

Thanks!

Hi, Dwayne,

Do all of the LDG tuners that have memories use the same technique?
Including the AT-11MP with the upgraded chip?

Thanks,
Jim de K4GVO

4453. KT-100 problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-10-17 14:33:38 UTC
From: John
Topic: 4453 Message: 4453

I just recently installed a KT-100 on my new TS-480SAT. The 480 has the internal AT but wanted something that would tune mult-band on my vertical and doublet (I use a mechanical switch to select with a single antenna cable to the radio, on the Ant1 cable). It has been working great until this morning, and now when I power on the radio, the tune light glows red right away and does not go out. The tuner is quiet, does not seem to be in any tuning cycle. I press the tune button on the tuner and it won't go into by-pass, tune, and the red light continues to glow. I press the AT button on the radio and I get the high SWR signal from the radio and the tuner does not tune, change any indication, and the LED continues to glow red. I've rechecked by settings on the radio and it has the right ANT1 selected per instructions in the radio and LDG manual. I've disconnected and reconnected the tuner connections to the radio and the antenna. It has worked great up until now, so anyone have an answer to how to fix this. Is there a reset somewhere. I thought I'd try the group before taking the next steps. TU, 73, John

My upgraded AT-1000Pro has been working flawlessly since the chip replacement. However, at the time of the chip replacement I didn't realize that my shack 13.8V DC supply had failed, and I had been running off of the automatically switched shack battery for a while...unfortunately depleted the battery to ~10V. So when I first tried the newly chipped AT, it seemed to exhibit the symptoms you have described. After a moment's panic (ok, at least half an hour <g>), I discovered the power issue, replaced the PS, and all was well and has been ever since.

So perhaps ensure that the AT power is not marginal?

From: k8yzk
Topic: 4456 Message: 4456

Just received the Z11Pro (not the II), and wow it is very quiet compared to the AT-11MP(which is still a very nice tuner). The version on the chip say 1.5, so is there a updated version and if so what is the difference? Also anyone using the battery option and do you like it?
I am using mine with a IC-736 that has a bad tuner in it, and like the option of using the tune button again.

Thanks to all and 73

Jim,

We've had so many models and versions over the past 15 years that I don't think ALL of them used that technique. I know in the past five years all of the tuners have had either the 200 circular memories or the memory stored by frequency.

The AT-11MP, Z-11 and the AT-1000 with the last upgrade use the 200 memories.

1) LDG has announced the Free Surge Protector Rebate. Purchase any new (or refurbished) LDG tuner between Oct 15, 2010 and April15, 2011 and receive a Free SP-200 Surge Protector from LDG. The rebate form is downloadable in pdf from our web site. The offer is valid worldwide.

2) We have estimated that we will have about three to four months of upgrades left for the older AT-1000, Z-100 and AT-11MP tuners. The increasing costs and shortages of availabilities will make it difficult to stock these chips in the future.

In addition, it's possible that there may be times starting in 2011 that the chips may not be available at all for repairs of these older tuners.

Hi, Dwayne,

Thanks for the very proactive support of all the LDG products.

Have you had any upgrades to the AT-11MP since you first released the
memory option a couple of years back? I'd like to make sure I'm running
the latest.

Thanks,
Jim.

4462. Using Z-11 Pro II with random or long wire antennas

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-10-27 18:38:02 UTC
From: Gordon
Topic: 4462 Message: 4462

I have the Z-11 Pro II, and am want to know if anyone has simply attached a 'long wire' to the inner connector of the antenna plug, and if so - did the tuner match the 'long wire' (30m, or ~100 feet) without either a counterpoise or a ground connection to the antenna tuner, on 80 or 40m bands?

What is the shortest length which I could tune on 80 metres, using the above configuration ?

I have the 4:1 and the 1:1 baluns from LDG, and would like to hear from those of you who have used them with the Z11 Pro II and random/long wires.

My reason for asking is that when 'canoe-portable' on a wilderness campsite & QRP with my FT-817, I need the simplest antenna possible - which works reasonably well !

Gordon VE3JSJ

4463. Re: Using Z-11 Pro II with random or long wire antennas

Topic: 4462 Message: 4463

Gordon,

The challenge with end-fed random length wire antennas is some lengths represent a very high impedance at particular frequencies - a condition difficult to match with auto-tuners (which tend to be more limited in matching range - although there are a few exceptions), and most tuners in general.

Years ago, Alan Chester (G3CCB)(SK) proposed a simple solution: Select a wire length such that when used on the bands of interest, the chosen length presented a lower impedance and therefore was easier to match. The secret? Stay away from multiples of 1/2 wave length and opt for lengths in the 1/8 - 3/8 or 5/8 - 7/8 wave length. The trick is to find a single length where this property is true for all the bands of interest. Working through the math, here are the wire lengths he proposed:
26.5m for 160-10M use
15m for 80, 40, 20, 17, 15, 10M use
10m for 80, 40, 30, 17, 12, 10M use

While I haven't tried this particular advice with the Z-11pro, I believe this reasoning makes a good starting point for experiments. So, shorten your 30m wire to 26.5m and test!

I have the Z-817, which I assume is similar. I have a 34' wire in the attic, end fed. To get it to tune on 80 meters, I inserted the 4;1 balun, which I leave in for all other bands. Can't do 160, but can tune up through 10 meters. A shorter wire out the window, with no balun does 6 meters.

Topic: 4465 Message: 4465

Hi

Please can anyone advise me on a KT-100 tuning issue.
When using the tune button on my TS-870, the KT-100 attempts to tune on all bands except 40m. Nothing happens at all - no tuning cycle starts.
On all other bands it attempts to find a match.

My antenna is a 40m Dipole with 20m traps.

Any help would be appreciated.

Regards

Mick

4467. What is my new KT-100 doing?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-10-28 20:20:10 UTC
From: Andrew
Topic: 4467 Message: 4467

I purchased a new KT-100 antenna tuner yesterday. I got it all hooked up properly and used it to tune across 20 meters and it worked fine. On 10 meters, however, it wouldn't tune up on a frequency my TS-2000's internal tuner can tune, instead the red "Tuning" led flashes three times after the green "SWR" led goes out. Then I tried 12 and 15 meters and it does the same thing, flashing the red "Tuning" led three times after the green "SWR" led goes out. I tried 17 meters and it seemed to tune, but then it kept trying to tune while flashing between the red "Tuning" led and the green "SWR" led. I again tuned up across 20 meters with no problem, 40 meters, no problem, 60 meters, no problem, 75 meters, no problem, but on 160 meters it will not tune any better than my internal tuner, rather blinking the red "Tuning" led twice after a tuning cycle when it cannot tune up on a frequency.

Is my tuner working as designed? I've used my TS-2000's internal tuner to tune across the 28MHz portion of the 10 meter band, the entire 15 and 40 meter bands, as well as portions of 17, 20, 75 and 160 meters. The only benefit I can see from this tuner is the ability to cover the entire 20, 60 and 75 meter bands, but then I lose the ability to tune 10, 15 and 17 meters.

From: scotchmandr
Topic: 4468 Message: 4468

I just got an AT897 Plus today and am hoping that I can also do a manual tune like I can on my z817.

There may be times where I don't want to bother with the CAT cable (tired of it falling off on my z817). So, I don't see it in the manual (or I just missed it).

Can I just Switch to AM or PKT like the z817 and then hold the Tune button, Transmit on low power (say 5W or 10W) and let go of the Tune button while Transmitting.

Can this be done with the AT897 with the 897 or even another radio?

Phillip

The antenna goes to the red terminal. The black post goes to the ground/short coax/grounded to building ground.

Also, my feed to my 2 meter/70 cm J pole which is at the end of the attic, runs underneath, so acts as a counterpoise of sorts. This is in the attic off of the spare bedroom that is my "shack." I also have a switch at the mid-point (16') so that I can cut the antenna length down for high bands, if I need to. Prior to the Z-817, I was using a MFJ-902 "Travel Tuner," which is a "T" tuner.

I forgot to mention, the 4:1 balun is the LDG one. That can be run with one output terminal grounded, as an impedance transformer, not as a balun in the usual sense.

I ran on to a similar problem with my Z-817 versus my MFJ-902. The Z-817 would not tune some frequencies until I put a 4:1 balun as an impedance transformer just before the antenna. I have a not-so-long wire in my attic. Since the Z-817 is an "L" design, there are limits to the range it covers. I would assume the same issue with the KT-100.

If you can borrow an antenna analyzer (MFJ or the like), you can get a better idea of what is going on.

I solved my problem by using a 4:1 balun as an impedance transformer to give me better matches on 80 and 40 meters, in my case.

My antenna is an Alpha Delta DX-LB Plus dipole that shouldn't need a balun.

What I don't understand is why does it tune up just fine on the lower bands (except 160) but it can't tune up on a 10 meter or 15 meter frequency that my TS-2000's internal tuner can tune up?

Just a thought, but can you add or subtract a few feet from you coax run going to that antenna? Also I assume you have the tuner itself properly grounded. If not ground it to to a common ground that your radio uses.

I actually find it odd that the internal turner can do this, but not the LDG. Doesn't the LDG have a broader range than the internal tuner? Most internal tuners only work up to an SWR of 3:1.

4476. Troublesome IT-100

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-11-01 23:04:16 UTC
From: Jan
Topic: 4476 Message: 4476

Hi group,

In January this year I bought an IT-100 tuner for use in the car with an IC 705MkIIG.
After a few months it stopped working. It would not tune from the radio's tune button, or the tune button on the tuner. no lights on the LEDs. I also bought new cables.
Still no response from the tuner. I sent it back to the factory for a check, and got it back with a note saying that there was nothing wrong with it. It performed perfectly on the bench, I was told. I put it back in the car, but it was just dead. Since then it has worked off and on. Now it is not working, but it worked a month ago. I have tested the radio with other tuners, such as the AH-4, and AT-180. They work like they should. Are there others who have experienced similar problems?

Appreciate any suggestions. Thank you.

4477. New FT-2000 cable

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-11-04 13:15:30 UTC
From: Dwayne
Topic: 4477 Message: 4477

LDG is just releasing the IC-2000 cable that allows generic LDG tuners (Z-100Plus, Z-11ProII, AT-100ProII, AT-200Pro) to interface to the FT-2000 radio. The cable will key the radio while the tuner tunes. It does not supply DC power to the tuner.

The suggested price is $10 and will be available from www.Cheapham.com shortly.

Date: 2010-11-06 03:47:01 UTC
From: Ken
Topic: 4479 Message: 4479

My Kenwood TS-590S internal tuner can handle poor matches better than most other internal tuners but it is no match for the Z11Pro.

I realize I can use the Z11Pro without a cable connected to the radio. I would rather have the convenience of using the tune button on the radio, that would provide mode change and power reduction.

Is the Z11Pro compatible with Kenwood AT-300 tuner interface. Is there an interface cable available?

Date: 2010-11-07 05:17:19 UTC
From: ab9ta
Topic: 4480 Message: 4480

Greetings,
Does anyone know how to do a reset on the AT-100ProII? I can't find anything in the manual.. I tried the reset procedure in the AT-100Pro manual, (hold Func + Ant + Tune upon power on, then release). That doesn't seem to work, I'm still getting memory tuning, so I don't think it actually reset.

I have a couple of tuneups in memory that land on a high SWR condition. (I think I accidentally hit store when I shoudn't have.) When I force a manual tune on a nearby frequency, the tuneup is correct. I'd like to get the tuner to learn the right tuneup.

I'm also having an odd problem, the SWR reading on the Tuner doesn't match the SWR reading on the TS-480 - on 160M only.
The tuner shows a much higher SWR than the radio and keeps wanting to retune.
On all other bands the two readings are very close when matched.. I'm hoping a reset will cure this also.

73, Bill AB9TA

Hello Ray/Peter,

If the tuner retunes after it has found a match, then you may need to raise the threshold, or improve the ground. Try adding RF chokes on the interface cable, ground or DC supply cables.

Try adding about 10 feet to the feedline on the antenna side of the tuner. You might just have to do this on 10 meters. I had a G5RV years ago that did the same thing.

Hi Walt,

There are so many variation of the original antenna and each can be different..

How are you feeding your G5RV?

Do you connect your coax directly to the twin lead where they join or do you use a balun?

The original G5RV was never intended for this kind of use. It was designed to be used with tube rigs. It was especially good on 20 meters from what I remember. The other big plus of the antenna was that it didn't need a tuner.. For those of us who still remember the tube radios, you had to tune them up to match the antenna load and thus they could work with a broad range of loads eg. 25 to 200 ohms for example.. They were not fixed to the 50 ohm requirement of the modern radios.

If your into some experimenting.. I have found that I got much better performance with a balanced antenna fed with the twin lead which is then attached to a balun where you connect the coax. It makes more sense to me to connect the balanced feed line to an antenna that is the same length on both sides, making it a balances load. I've used antennas like this for the last 25 years and have found they tune easily on all bands.

Due to limited at the senior place where I retired, my current antenna is a real compromise but it works, very well, on 80-6 meters. Total length is 80 feet, fed in the center.. (40ft per side) with a short length of 300 ohm TV twinlead. The twinlead goes to an LDG balun where the coax is connected for the run into the house. The highest point of the antenna is 22 feet with the ends around 12 feet. With this antenna I often help out with nets and even work DX. I even worked some DX during the SSB contest last week and that is with 100 watts. In the past, I've used longer and higher version which also tuned well on all bands.

Do yourself a big favor, don't waste your money buying antennas. You don't need a G5RV or a tuned 80 or 40 meter antenna to use with an auto tuner.. Having an antenna tuned to a specific band can sometime cause problems with these tuners. Wire antennas are still one of the things we can build and play with ourselves.. even us older OMs.. hi..

Most of all have fun playing with your wires, stringing up various combination.. what ever you can hang up most likely will work fine. When you make contact with an antenna that is some what unusual you have that pride of doing your own thing.. In the process you might invent the next great famous antenna.. hi..

Dwayne, could please reply to this??

I've done a bunch of surfing and studying and from what I found it would appear that the Icom and Kenwood AT-300 tuner standards are completely different. (not compatible)

Can anyone confirm this from their experience? Has anyone tried to wire the tuner on their LDG tuner that works with Icom radios to the AT-300 connector on a Kenwood rig?? Be honest.. confess hi..

As to my comments about the TS-590S tuner, removing an antenna switch and patch cable for the feed path to the radio solved my problem. I can now tune my antenna on 80 - 6 meters with the built in tuner.

Hello Walt

Thanks for the timely article, well ?I had been through ?a similar situation here for the last couple of months. My qth is being reconstructed and had to remove all my beloved wire?multi band?antennas. The temporary qth where we stay does not have provisions to put up large antennas on the terrace. However with full faith in my ldgz11pro I have rigged up a wire dipole that is 16 feet on one arm and 35 feet on the other up about 30 feet. The contraption is fed with a coaxial and I am able to make contacts in all bands except 3.5?MHz. For me the main bands 7 and 14 are?perfectly?workable these days.There is lot of scope to experiment with wire antennas and instead of keeping quiet one can?definitely?work around this way.

Hi Walt,

There are so many variation of the original antenna and each can be different..

How are you feeding your G5RV?

Do you connect your coax directly to the twin lead where they join or do you use a balun?

The original G5RV was never intended for this kind of use. It was designed to be used with tube rigs. It was especially good on 20 meters from what I remember. The other big plus of the antenna was that it didn't need a tuner.. For those of us who still remember the tube radios, you had to tune them up to match the antenna load and thus they could work with a broad range of loads eg. 25 to 200 ohms for example.. They were not fixed to the 50 ohm requirement of the modern radios.

If your into some experimenting.. I have found that I got much better performance with a balanced antenna fed with the twin lead which is then attached to a balun where you connect the coax. It makes more sense to me to connect the balanced feed line to an antenna that is the same length on both sides, making it a balances load. I've used antennas like this for the last 25 years and have found they tune easily on all bands.

Due to limited at the senior place where I retired, my current antenna is a real compromise but it works, very well, on 80-6 meters. Total length is 80 feet, fed in the center.. (40ft per side) with a short length of 300 ohm TV twinlead. The twinlead goes to an LDG balun where the coax is connected for the run into the house. Dwayne,

What do the LDG tuners expect to see on the Radio input connector that enables them to tune with the radio's tune button. Seems to me that some sort of interface can be made that will allow different radios to work properly.

Thanks Dwayne,

I hope someday you might sell as tuner that allows the user to select the type of radio interface to use. The MFJ guys are selling one like that now. This would be great for those with several radios, of different brands, not needing to buy several tuners. The RF tune solution works but not as nice as being able to use the radio's tune function.

Hi Ken,

Yes, that's a tough call. We used to do that about 5 years ago. We had little interface boxes with microprocessors inside that would convert the interface to different radios and our generic tuners.

However, that added $50 for every interface and an extra level of complexity. In the end, it was way easier to have a plug and play tuner specifically designed for a specific radio (or group of radios).

We couldn't justify a $175 tuner and then another $150 for three interface cables for three different radios.

From: at91r40008
Topic: 4495 Message: 4495

I like the LDG tuners but I always struggled to find an affordable box to use my Z11-Pro outside.
I tried different electrical boxes but the bugs and in particular spiders always got in. So did the humidity.
Finally, I realized that I could use one those hermetic instrument cases that I was using for my K2, KX1 and K1. Yes, I know, why did it take me so long to think about it!
And they are not expensive ($24). Add to this a pair of barrel connectors and two male/male coupler. The mechanic was easy as the plastic is relatively soft.
It has been outside for two months now and we had pouring rains a few times and no bugs nor humidity inside.

See pictures in the picture section for details.

Yvon :

Do you know what sort of plastic these boxes are made out of?

Hint .. look for the plastic recycle code. Your box looks like a Pelican case but not exactly.
If it is Polypropylene you might get a year of continuous use before it falls apart due to UV. I considered using a Pelican case but discovered that they are Polypropylene.

I tried a number of different boxes and finally settled on a Lexan waterproof box made by GSI :

http://gsioutdoors.com/products/pdp/lexan_l_gear_box/ .

I just bought a new one this year as I found that after a couple of years the rubber on the seal of the previous one started to deteriorate (it became sticky) and started to let in a bit of moisture. Lexan is very easy to work with. It is very hard but not brittle and can be drilled with a wood bit without cracking. Lexan is very UV tolerant.

Michael VE3WMB

P.S. My LDG QRP Autotuner tuner sits on the side fence in the back yard and is used to match a sloping 100 ft delta loop strung between the house and the back fence.
I'll post some pictures.

P.P.S. I always leave a very small drain hole in the bottom of the box to let out any moisture. My tuner has been outside for at least 5 years.

got a link ?

I found a box at the local Farm & Fleet store in the fishing/boat isle,made by Plano as a " marine waterproof storage box",that has a waterproof rubber seal in the lid.Plenty big enough for the LDG Z11 Pro,an MFJ bias T,a balun or unun and then some,I think it was $10 if I remember right.I'm going to get another.

4498. Waterproof External Box for Auto Tuner

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-11-10 14:27:49 UTC
From: ve3wmb
Topic: 4498 Message: 4498

I just created a new folder in the Photo section of this group and posted some pictures of my externally mounted LDG QRP Autotuner. Just look for the folder starting with "VE3WMB".

This tuner has been operating outside for the past 5 years. As I mentioned in a previous posting, I am using a waterproof Lexan camping box made by GSI. This box has been in use for the past year, replacing one that was out for a couple of years before the seal started to fail.

Previously I tried using various food storage containers but inevitably some part of them was made out of Polypropylene and crumbled in less than a year's exposure to the sun.

BTW the antenna is a sloping 100 ft Delta loop with the apex at about 20 feet (attached to the raingutters on the house) and the base is at about 8 feet, attached to the back fence at the corners of the lot. I am using an LDG 4:1 balun and the Original QRP Autotuner set to AUTO mode. Power is supplied via two conductors of rotator cable (both leads fused) to a P/S in the shack. I use about 8 feet of homemade open wire line from the antenna feedpoint (approx. 1/4 wave on 30m down from the apex) to the 4:1 balun) I use this antenna primarily on 40m and 30m but it will match on 80m and makes a pretty reasonable RX antenna on that band. The tuner will match it from 80m through 10m.

Michael VE3WMB

P.S. I hope that this provides some ideas for anyone else looking to mount an LDG tuner outside.

The problem with the 450 and 950 is that the interface is serial data. The Icom and Kenwood are simple discrete signals that are ground activated. Although Kenwood uses a different signal type than the Icom, those two are more similar than the Yaesu serial data system.

The exception to this was the 857 and 897 and we used the ACC port to key the radio with a ground going signal.

It's been very frustrating for us to build tuners for Yaesu radios as nearly all Yaesu radios have a unique serial type interfaces. The first one we did was the FT-100, then the 857 and 897. These were all fairly similar. Then the 817 was different (not enough DC power on the CAT port to run a tuner). Then 450 and 950 and those were again different. Lastly we're adding a tuner this month for the FT-847, but that is yet different and even uses a different connector for the CAT port.

Fortunately, the FT-2000 has a port that is similar to the ACC port on the 857/897, so a simple cable that provides ground can key the radio wile the tuner tunes. However, it uses yet a different connector so we had to make yet another cable.

Hello,

thank You Dwayne for reply. In that case I not mean the tuner re-tune after it has found match but it re-call from memory preview setting although I tuned it manually to exact SWR 1 and tried to store it. My understanding was that when I will push button to tune my antenna in auto mode (threshold is set to lowest) and I find that final SWR is not 1 then I will be able to manualy fine tuning to SWR 1 and store it. After the tuner should stay on that untill SWR will change. Unfortunatelly tuner after key down immediatelly re-call from memory preview setting reached in auto mode which is worse SWR than my manual fine tuning. Simply it seems like tuner does not store my manual tuning or not re-call it from memory...

Thank You for advice.

☐Dwayne:
I guess I was hopeing that since you were able to make a tuner that worked with the FT-450 and FT-950 you would be able to make a interface to work with the 950 and 450 with your other tuners since I have both radios.

Subject: [LDG-auto-tuners] Re: FT-950 and LDG AT-1000Pro

The problem with the 450 and 950 is that the interface is serial data. The Icom and Kenwood are simple discrete signals that are ground activated. Although Kenwood uses a different signal type than the Icom, those two are more similar than the Yaesu serial data system.

The exception to this was the 857 and 897 and we used the ACC port to key the radio with a ground going signal.

It's been very frustrating for us to build tuners for Yaesu radios as nearly all Yaesu radios have a unique serial type interfaces. The first one we did was the FT-100, then the 857 and 897. These were all fairly similar. Then the 817 was different (not enough DC power on the CAT port to run a tuner). Then 450 and 950 and those were again different. Lastly we're adding a tuner this month for the FT-847, but that is yet different and even uses a different connector for the CAT port.

Fortunately, the FT-2000 has a port that is similar to the ACC port on the 857/897, so a simple cable that provides ground can key the radio wile the tuner tunes. However, it uses yet a different connector so we had to make yet another cable.

Hello Petr,

It may be that the tuner is finding the best SWR that "it" thinks it can find. Since we store a memory for several KHz of frequency, we also look at the next higher and lower memory to see if it finds something better. This is because our frequency counter is not as accurate as the one on the radio and it would take many tens of thousands memories to come close (and it would take an obnoxiously long time to set all your favorite freqs).

So even if you find something better and store it, if the tuner thinks it can find something that "it" thinks is better, it will choose that every time.

If you are using an external meter, they may read something different. We understand that it really only matters what the radio thinks is a good SWR, so if an external meter or even the tuner think something different, it does not matter.

We don't normally recommend setting the threshold to the lowest level. That sometimes will cause an abnormal amount of retunes. We'd like it to be set at around 1.7 or 2.0 so that it only memory retunes when the match is really bad. We're presuming that you have come from another band and will be happy with the memory tune. If not, then you can do a full tune with adjustments to the up/down of the L and C to suit your requirements.

From: Barry
Topic: 4506 Message: 4506

Hi Dwayne - I am using the AT-1000 Pro Autotuner (with the most recent chip upgrade) with an Icom 756P3 and a PW-1 in front of it. When I put the tuner into bypass mode (three blinks of the Tune/Store button) and transmit, the unit reverts and is no longer in bypass mode. I have a triband yagi attached to Ant1. Is this proper behavior or is there something wrong?

Thanks. Barry, N2MAD

4511. LDG Z-11Pro not tuning anymore

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-11-20 17:17:51 UTC
From: dl4eax
Topic: 4511 Message: 4511

Hello,

I am using a Z11-Pro to tune a horizontal loop with 120 m circumference.

One day, after tuning the loop on 160, the tuner stopped working.

It also does not work anymore on other bands and with other antennas.

So I got it form the remote mount into my shack and did some analysis:

- Autotune does not start tuning if SWR is above the treshold (2.0).
- A manual full tuning cycle rattles the ralys for a while and I can see the SWR going up and down. But at the end the value is not stored and used. The LED displays a final SWR of less than 1.5 (green LED).
But the SWR tells something completely different...
- A restet did not help.
- There are no signs if burned components inside the box.
- My spare Z-11Pro works just fine with the Loop.

Based on my analysis I assusme the the tuner "thinks" that the SWR is good and there is no need to tune.
So I assume that one of the components that are responsible for SWR measurement could be the culprit.

Any idea where to start the repair?
Is there a circuit diagram available?

Thanks and 73,

Michael - DL4EAX

I couldn't find the code but it is for outside use.
I did protect it from the sun and more importantly :) from the birds droppings.
While living in Phoenix (AZ) I left one like that outside with only discoloration but no damage. Fortunately the sun in San Diego is not as bad as in AZ and we have a lemon tree as well as some bushes keeping it most of the day in the shade.

4513. AT 600 Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-11-22 04:00:41 UTC
From: shibukiau
Topic: 4513 Message: 4513

I am using a AT600 Pro with a TS480HX at a remote controlled station. The antenna is a Zero Five 26 ft vertical with elevated radials.

The tuner tuned beautifully from 80 through 6m until a few weeks ago when it stopped tuning up on 8om, even though it tries a bit. It still works well on the other bands.

From what I can tell nothing has changed on the antenna or feed line which is low loss 9913.

The tuner is turned on and off remotely with the station through an IP controlled power bar.

Could the software have been corrupted somehow? If so how does one do a reset? Rebooting, which I do does not change the behavior of the tuner.

Could there be a fault, such as perhaps a faulty relay that won't switch in the proper L/C component?

Is there a generic weak point with this tuner?

Any assistance would be appreciated.

Until this occurred, the tuner has worked like a charm, very nice!!

Cheers!
Lloyd

4514. Powering the AT600 on and off remotely

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-11-22 00:25:00 UTC
From: lgroom@frontiernet.net
Topic: 4514 Message: 4514

I'm using an AT600 in my station that I access remotely. I can turn the power off to the AT600 via an internet remote power plug that I have the 12V power supply plug into. While the tuner is turned on I can shut it down by turning the power plug off, but I'm not sure if that will harm the tuner or not. I've tried it and the system works as far as turning the tuner off and on, but when I turned it back on, the tuner came up with the bypass and Ant 2 light on and I was unable to get the tuner to go into bypass until I did an auto tune sequence.

Any ideas if it's okay to turn the tuner on and off that way, using the 12V power as a switch instead of the front panel?

Thanks

Larry

Should be fine Larry as I've been doing that for several months now with my remote station. So far it has always come back on in the Auto mode and tuned. I have run into a problem on 80m but that is a different issue.

rick,

dont have a problem powering down.. it is turing it on..

Power butten will not turn it on.. have to unplug the power source and it will power its self up.

Dones yours come on ok? tnx Murf

Subject: [LDG-auto-tuners] PathMinder Support?

Not sure if anyone saw this so thought I'd ask again ...

Are there any critical components in the PathMinder that are no
longer available, or easily substituted for, should they fail?

Could one remote-locate the PathMinder and run a multiwire
cable to a matching set of switches (and perhaps also LED's)?

Happy THANKSgiving!

Hi Rick,

Agreed, no big deal but it's a backward step for a good tuner :-).

Hi Pat,

Yes it can be a pain as when you switch the main shack PSU on you don't always need the AT1000PRO switched on. I'm also thinking about going back to the old chip for this reason plus it doesn't do the PEAK reading very well with my pulse tuner for the linear amp. Maybe there will be another upgrade soon :-).

☐I have had no problems after the upgrade. I always had to hold the power button for 3 of 4 seconds to turn off even before the upgrade. If the peak reading does not work for you turn it off. I have no problem with the power button it turns off a the manual tells you then right back on with another push.

Tnx Jimmy, beginning to wonder if there is a possibliy of a bad chip.. That is the only thing I can I see wrong.. with mine. The pep meter is close to my inline pep meter.. ok there.
I can have taken the wall wart ps out of line.. and hook to the shack main ps and can turn the power on and off easyer there.

Tnx for all you input.

Murf

4534. KT-100 specification which source is correct.

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: Ken
Topic: 4534 Message: 4534

Dwayne, I notice that LDG has a discrepancy in the specs given for the KT-100.

- On the LDG website, KT-100, Specifications page and the tuner comparison, it states:

Tunes 6 to 1000 ohm loads (16 to 150 on 6M), 6 to 4000 ohms with optional 4:1 Balun.

- In the KT-100 Operations Manual, it states:

Tunes 4 to 800 ohm loads (16 to 150 on 6M), 16 to 3200 ohms with optional 4:1 Balun.

Which one is correct??

Thanks Dwayne!

I should then expect performance similar to the Z11Pro if I decide to go that way, for the convenience of the tune button.

Date: 2010-11-30 22:49:44 UTC
From: Dwayne
Topic: 4537 Message: 4537

We were hoping to be shipping the YT-847 by the end of November, but we got a few days behind. The new schedule is that we should be shipping to dealers by the end of this week and they should have stock next week.

Hopefully it's still in time to make it under a few Christmas trees.

Date: 2010-12-09 13:29:12 UTC
From: ANDY - N1ORK
Topic: 4537 Message: 4538

Thanks for doing this Dwayne!

I've only used it for a couple of days and on all but 10 and 80m. I use a G5RVjr inverted-V inside my 16' tall attic. I'll be trying it out on 10m for the ARRL 10m contest. Here are my first impressions in no particular order:
1. Smaller than the FC-20 and only one antenna input.
2. If you had the Null Modem cable from your PC to FT847, get a straight-thru DB-9 with female connectors on each end to connect to the YT-847.
3. Read the operation manual for the YT so you know what to expect.
4. There is no seperate power indicator on the YT, but it does power from the FT Tuner connection.
5. When you first hit the tune button, it's a surprise. The SAT lights lite up, the A vfo shows memory 1 146.000.000 mhz (at least in my case), what was originally in the A vfo (or what you wanted to tune up for) goes to the B vfo as 20 watts in AM mode and the tuner goes through it's tuning cycle. This is all explained in the book.
6. The initial tuning cycle on each band can take a while depending on the band and antenna. You may see 'HiSWR' and 'CAT' on the FT during this.
7. The YT has tune memories, so subsequent tuning cycles on a band is faster.
8. The YT doesn't seem to auto-tune as you switch bands on the FT as the FC-20 does, but a 1 sec. push of the YT tune button is all it takes.
9. The best thing is that using N3FJP's ACLog program, I can turn on the DXSpot window and click on a spotted call. The FT will then jump to that frequency and mode. If I want to work that station, all I have to do is hit the YT tune button for a second and go! I now also have this feature with my FT-857 since getting the YT-857 from LDG.
10. It seems that the YT tunes my G5RVjr (40-10m) better on 80m than the FC-20 did.

I'm glad I purchased this as it has made it easier to integrate the FT-847 with my PC while enabling me to use an auto tuner. I also sent in for my free lightning arrestor (forgot about it when I got the YT-87).

If there are any other Q's I'll try to post answers here.

4539. At-897 not keying fix j1027

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-12-14 02:56:50 UTC
From: ke7adu
Topic: 4539 Message: 4539

Just purchased a refurbished at-897 from cheap ham.com for $120. The first unit was DOA but the second unit works well. I did run across one issue it thought was worth posting. I had moved J1027 from TXREQ to TXGRND shortly after I bought the ft897 to allow keying of my al-811 from the accessory jack. This jumper needs to be returned to the factory default if you want to use the one touch tuning with the at-897.

4540. YT-100 and FT950

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-12-16 04:15:42 UTC
From: Leonard K. Pennock
Topic: 4540 Message: 4540

Can the YT-100 be used with the FT950? The FT950 supports working with the Yaesu FC-40 and the FC-40 supports the FT-857. So is the YT100 compatible with the two radios?

--

Date: 2010-12-18 13:11:29 UTC
From: Leonard K. Pennock
Topic: 4541 Message: 4541

Dwayne

Can the YT100 be used with the Yaesu FT-950 by building a cable that converts from the mini-DIN that the 857 used to the DB9 that the FT950 uses. I.E. is it just a cable conversion or is there a level and signal difference. Seems that since the YT450 and YT100 both use the cat interface there shouldn't be a difference but don't want to smoke the radio or computer.

Hello Leonard,

We wish it were that easy. Not to knock Yaesu, but with every two radios that they come out with they completely redesign the CAT interface. So the same commands for one radio are now something different on the new one.

Not much of a way to get around this as the new radios have more and different features as their older line (technology progresses).

So the 857 and 897 are the same, the 450 and 950 are nearly the same, but the two sets are vastly different.

All of them use the word CAT to mean the interface between a computer and the radio. However the implementation can widely vary between models.

OK, maybe I am tired.

I want the AT-600 to remain in Bypass. While key-down, I push the TUNE button and BYPASS light turns on. I key up. As soon as I key down again, it begins a tune. Is this defective unit? Or more likely am I defective?

4550. Z-11 Pro II mobile

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2010-12-29 14:34:22 UTC
From: LonnieW
Topic: 4550 Message: 4550

I'm the proud owner of a new Z-11 Pro II tuner and am wanting to use it mobile. I have it mounted in the back of my service van which is a full-size extended Ford van. My antenna mount is at the side of one of the back doors about 24 inches below the rooftop. I have a two foot jumper between the antenna mount and the tuner, then about 18 feet of Mini-8 to my FT-100D.
I'm trying to find the best antenna to use on as many bands as I can. At first, I used a 102 inch Stainless steel whip. It tuned nicely on 20M and 10M but that was all. This morning I tried a 40M Hamstick and it only works on 40M.
Do any of you use a similar setup? Any recommendations on antennas to try? Thanks and 73.

Lonnie, N9IUI

4551. Switching antennas

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: kf7dur
Topic: 4551 Message: 4551

Just purchased a Z-100Plus to use with my Yaesu FT-857D. It works great.
My question is this:
I like to experiment with different antennas and I do a lot of swapping back and forth (when the weather is warmer). Will the Z-100 detect a mismatch and retune when I swap antennas or do I have to manually initiate a retune every time I switch antennas?

Ken

Hi Howard,

Its rather early in the morning to think about such things, but in the area you have that could you not install a Delta loop using a 500 spool or wire?

I ask as here that is what I have where 30 fee of ladder line come down to a 9:1 ByteMark balun with 30 feet or RG-214 and my AT200PC and other LDG tuners that I have tunes it just fine on all HAM/MARS/SHARES frequencies that I have ever used it on. It resonants close to the lowest MARS channel we use for ALE and although 20-30 feet above ground, depending on where you stand on my NC mountain side, it works great for not only NVIS but is also gang busters on Skywave above 12Mhz as well from all reports. If you can't quite spool out a full 500 feet of wire, use as much as possible, another 100 feet would make a big difference.

For the details the approach taken with my 2Mhz Delta Loop, which has now been up for 3 three winters and taken quite a bit of ice and large tree limbs hitting it and only broke once (in the future I am changing over to jacketed copper clad steel wire that I had originally planned to use but could not get in time for my buddies visit from NJ who is my tree climber).see:

Hi Howard,

I have discussed this subject with you in MARS
circles in the past Howard. If you were to build
an antenna to my specs you will likely achieve
what I and others do, an exceptionally good all
band loop. Rob, KD4YOL recently built one
replacing his commercial antenna could not be
happier. I have a commercial antenna here as a
backup for use down to 2Mhz, installed 100% per
the manufacturers specifications, it works, but
does not work near as well as my loop and when it
rains, this full insulated antenna changes
resonance constantly and nothing, not even my
AT200PC or AT200PRO can keep up with it, but yet
this is a very popular antenna in MARS circles,
its worthless for ALE when it rains.

Anyhow, failing to build a loop my way, just add
more wire to your antenna to lower its point of
resonance as a starting effort in netting your
antenna down toward efficient MF use and all else
you have in place may work fine after you
increase the antenna some what, just add as much wire as you can Howard.

As to all else you mentioned, I have used such
methods at higher frequencies years back in my
antenna building learning days and I really take
exception with a lot of it, especially the need
of long transmission lines based on velocity
factor of the lowest band of operation, that is
exceptional wasteful and a pain to deal with at
lower in frequency. All balun ratios have their
place depending on the application in my opinion,
using a 4:1 as a general purpose ration can also
be condoned, however based on my experience
proper balanced to unbalanced ratios work the
best and make life the easiest when to comes to
tuning the transmission line/antenna system when going off resonance.

Just my opinions Howard, for what they are worth
to you based on proven experience with all this stuff.

I think the reasoning is a NVIS antenna is low to the ground and thus has a much lower impedance than the same antenna at height. Also the rational that you need 9:1 balun because you are going from 450 ohm ladder line to 50 ohm coax is also a terribly flawed concept because the 450 ohm ladder line was never matched to the antenna's impedance. The antenna is not 450 ohms, and nobody is using any matching device between antenna and ladderline to cause them to match. Thus the idea of matching other end of the ladderline is a useless endeavor. According to the ARRL antenna handbook a 1/2 wavelength length of feedline will always yield the exact impedance of the antenna to the antenna-tuner/radio. For 80m that is 128 feet of ladderline per DX Engineering. DX Engineering's website has recommended feedline lengths for various antenna types and this makes a very big difference for those who wish to make the effort. It's perfectly OK to loosely coil excess feedline - but it shouldn't touch the ground - per Philip Karras. I have had it loosely coiled and also had it blown by high winds to be all over my wooden deck in a big mess - it makes no difference. I know this is a very different school of thought compared to those who use a 9:1 balun and any random length of feedline that happens to be the distance from antenna to shack. However baluns and feedline length is not really the subject of this wish-list posting.

Hi Howard,

Sorry for trying to help for Howard, my mistake.

Your right, it sounds to me like a public forum is not the place for your thread, your mistake.

Lastly, just as an FYI regarding your comments on the AT200PC and the FLEX 5000 optional tuner, for all intents and purposes, its the same ATU. As used in the flex its mounted internally in the TX path of the radio only and under firmware control of the radio and not yet exposed to CAT control.

Have fun.

4559. AT1000 Problem over 250 Watts?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-01-13 19:22:42 UTC
From: techman2512
Topic: 4559 Message: 4559

I have an AT1000 tuner with the chipset 1K 2.5 which I presume is the ver. 2.5 upgrade. The issue is that after doing an autotune for my 160 - 10m windom, the SWR is 1:1 I then put the amp online and key with only 300Watts the tuner clunks the relays a couple times and the SWR climbs to something above 2:1? I can keep the key down and try to retune the AT1000 and both needles just sit and bounce....but no retune?

Any ideas?
Thanks,
Mark ND8X

Pe LDG recommendation they said I was getting RF in the unit as It can't tune on it's own. That was a lesson in futility..I put on over 10 chokes, used a 12V car battery to feed the tuner only; to isolate it....and even now when I key it with the amp it actually shuts off the tuner??? Seperate grounds to each device in my system. Goes from perfect SWR with no amp to +3:1 SWR with amp. I think I'll abandon this and get rid of tuner as it works flawlessly and faster with my Heathkit 2060A

☐As far as I know the tuner will not go into a tuning cycle over 125 watts it will not tune with 300 watts input. Don't know why it would try to retune. Try turning off auto tune on the tuner.

Maybe your amplifier is presenting a different impedance than the radio
that you are using to tune up with?

If you use a manual tuner, can you tune up with the radio barefoot, then
switch in the amplifier and still see the same VSWR? Just wondering....

The catch is that it's an AT-1000 (non-Pro), so it does not have an Auto mode. It should never change relay settings unless the Tune button is pressed. So either there is RF getting into the tuner to cause it to change settings or the tuner is defective.

We're handling this directly, so I'm not sure why he is reposting everything to the group. Maybe just venting as it's a frustrating situation when things don't work as expected.

4564. Z-100PLUS tuner and Kenwood TS-570SG

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-01-16 03:41:40 UTC
From: Joe
Topic: 4559 Message: 4564

I have been using a Z-100Plus tuner now for quite awhile. The tuner is mounted remotely in the attic of my house and it feeds a dipole fed with ladder line. Coax runs to my basement shack, along with a control cable to my ICOM IC-706MKII. This configuration has worked great on all bands, but my IC-706MKII has developed problems . I have a Kenwood TS-570SG that I now want to use, but have no way to control the tuner. It would be nice if I could remote the controls of the Z-100plus.

Any ideas?

Joe,

4565. YT-450 Question

From: k8yzk
Topic: 4565 Message: 4565

Good Morning to All

Quick question on the YT-450, I hooked it up and set up the FT-450 I just got per the instructions. Now as I read in the LDG manual, to tune the tuner I use the button on it not the one on the radio correct. I kow I have it hooked up correctly, as I used the PC DB-9 to connect to HRD.

Thanks and sorry for the dumb question, just want to make sure both the radio and tuner works as they are suppose to.

Hi Kurt,

Not a dumb question. Yes, you have it correct. Press the Tune button on the tuner to start the tuning process.

Kurt,

Sorry, no chance of that being developed. Yaesu has the ability to change how the Tune button on the radio works with firmware upgrades. They could easily come out with a new version that would disable the tune button if it saw our commands.

I heard unverified rumors that they already did that to BetterRF. Even if it were not true, we know they "could" do it and that's enough to scare us away from attempting that method.

i'm thinking of getting a tuner for my first time. i'm thinking of the Z-100plus or the Z-11pro 2. i'm having to go cheap as i'm on unemployment and returning back to school to get my GED. is there any know problems with each of these tuners that i should know about. how is these tuners to run and understand for someone that knows nothing about tuners and/or antenna?
K7CDL
Ron

4573. Information LDG K-OTT with AT-1000Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-01-20 18:43:50 UTC
From: wb8nbi
Topic: 4573 Message: 4573

I just bought a LDG K-ott interface to use with my new Kenwood TS-590S and my LDG AT-1000Pro. It works great just press and hold the AT button for one second and the radio keys at 10 watts CW the tuner tunes and then goes back to where you were.

4574. AT-200Pro Questions

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-01-20 19:50:29 UTC
From: n8ob
Topic: 4574 Message: 4574

I searched the group but couldn't find an answer. As per the manual, I hold function key while turning on the power. It should indicate the firmware version. It doesn't indicate anything similar to the manual.

SWR indication reads zero almost all the time (when tuned) but an external SWR meter between the radio and the AT-200 indicates some SWR. The external SWR meter was checked into a dummy load and into a 100 ohm load and indicates correctly in both settings. What am I missing?

Robert,

We're moving away from showing the version number on the displays. We're now recommending that the user take the lid off to read the version number. The manual probably still needs updating.

#2) when you say some SWR, how much is that? Most low cost SWR meters are +/- 10%, so all of them may be within spec.

Only issue I've seen with the Z11pro which LDG lists as the same issue with the z11pro2 was it would try and tune a signal that was out of the frequency range it could tune. FT857 had enough leakage from V/UHF to the HF port to cause the Z11pro to tune. I doubt you will see that kind of issue with your radio. The problem was a combination of the RF leakage and the fact the Z11pro would tune with .1W input. The LDG web site doesn't list this as a problem with the Z100plus.

It shows an indication of about 1.7 to 1 on 2 different SWR meters on the particular band and frequency. The AT200 shows the SWR as 1.1 or no indication at all. It's not a big problem but it has me wondering about the accuracy. I still use the external SWR meter to verify the settings. My previous unit, an AT-11, showed the SWR indication more accurately under the same circumstances. (At least they agreed).

When you say the external meters are showing 1.7, is that between the
LDG and the Radio or between the Tuner and the antenna? The tuner
reports the matched number no the antenna SWR.

Try this experiment. 1. Add several feet to the length of coax between the radio and the meter. 2. Check SWR. 3. Add several feet to the length of the coax between the meter and the tuner. 4. Check SWR. I can almost guarantee you will get different readings in each of the above situations. The only meter that is important is the one on the radio. As long as you get full output from the radio and your SWR is under 2:1 you are not hurting anything. You still have the loss in the non-resonant antenna.

It's not a big problem but it has me wondering about the accuracy. I still use the external SWR meter to verify the settings. My previous unit, an AT-11, showed the SWR indication more accurately under the same circumstances. (At least they agreed).

I have the Z-11PROII. It seems to be the official tuner of our ham club.
None of us have had any problems with it, and I know of at 2 multi-band,
multi mode rigs that are connected to them with no problems reported.

We operated 3 HF rigs in close quarters at Field Day last year without a
hiccup.

Not sure on the Z100plus as I haven't used it. But most of the other
LDG tuners will do a tune cycle on transmit as soon as they see a SWR
above the tune threshold.

Not sure what the difference is between the z11Pro and Z11Pro2. Specs
in my manual for the Z11pro indicate it is a better but larger tuner
than the Pro2 specs on the web site. Here are the specs with a difference.

Pro Memories: 8000 3D memories
Pro2 Memories: 2000

Pro tune time: .1 to 4 seconds full tune
Pro2 tune time: .1 to 6 seconds full tune

Pro Power: 8-16Vdc
Pro2 Power: 6-16Vdc

Pro: 7.5x5.75x1.75"
Pro2: 7.7x5.0x1.5"

Wouldn't read too much into these specs though.

Comment: A motivation for measurement on the antenna side, aside from this demonstration, would be to alert you if something degrades the antenna that needs attention (corrosion, things falling off, ...). Implicitly, you would have confidence that the radio is still providing full output because you would see that the antenna-side SWR is within the bounds that the tuner can handle.

The SWR between the tuner and radio should always be less than the tune threshold so the only reason to put a SWR meter there is if you don't trust the tuner. Putting the SWR meter between the tuner and the Antenna will show the SWR of the antenna so if you are worried about your antenna changing it works best between the tuner and the antenna. For my money the best place to put the SWR meter is on eBay.

I can't give you an opinion on a ground as I run my station ungrounded.

Remember that a ground wire longer than about 1/4 wavelength acts more like an antenna than a ground. It can cause problems but you never can say for sure.

Normally people put swr meters between the radio and whatever comes next, tuner or antenna. If you have a decent meter in the radio you need not bother. As someone just pointed out a meter between the antenna and the tuner might give you a heads up if something goes screwy with the antenna that the tuner might hide.

Jim.

If the SWR meter (or wattmeter) is between the tuner and antenna, it
becomes part of the antenna and feedline that the tuner is trying to match!
If it is a meter with a remote head for the display, that too would become
part of the wiring being matched.

Probably better to keep the meter between the radio and antenna tuner.

4594. yt-450 not keeping memmory

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-01-25 13:23:42 UTC
From: Chris
Topic: 4594 Message: 4594

Good morning all,

In November I won the ft-950 in the gigaparts contest. I bought the yt-450 from cheapham as I was waiting for the rig to come.

Lately, after I tune a frequency, go to another frequency and tune, THEN go immediately back to the first frequency, the swr meter on the ft-950 shows I and I must do a re-tune. This all happens when I PTT.
There was one time that I checked into a net after tuning. When my station was called for my report and PTT, I had a high swrn the meter and had to re-tune. This morning after tuning a freq. for a net, I shut the station down to take my wife to work. Twenty minutes later, I did a PTT without any change of freq. and I had a high swr and had to re-tune.

Is this supposed to happen?

I have the AT-100 on my 746pro and an AT100pro an my 7600, and have not had this problem.

73 and thanks Chris kc2obn

Hello Andy,

I use Ham Radio Deluxe to control my FT-847, mainly on satellites, connected at 4800 baud.

The baud rate needs to be 9600 baud with the YT-847. (Flashing LED when radio set to 4800)

HRD can connect directly with the radio at 9600 baud, but will not connect at 9600 through the CAT feed through port on the tuner.

Regards

John

However if it's of a decent design, it shouldn't present an impedance
bump and should be invisible to the tuner, except for a change in the
velocity factor, which can be compensated for by changing the coax
length. Insertion loss on HF would be minimal.

The problem isn't an impedance bump. It is the problem of unknown points along the feedline (which the wattmeter is now part of) that have extremely high voltage nodes. Just going to a bad mismatch with 100 watts output can result in thousands of volts at unknown points along the feedline from antenna tuner to the antenna. If the wattmeter is at one of those high voltage points, it can surely be damaged!

Thanks for your comments Leonard.

1. The CAT RATE for the FT-847 can be set at 4800/9600/57600. No
option for 38400

2. There is no menu item to set CAT TOT or CAT RTS.

3. Contact with LDG Support indicates the tuner needs be returned to
to check the feed-through cat port.

Ok I was just looking at the manual when I suggested that number. Hope
it works out for you.

I'm using the AT 100 ProII tuner with an ICOM 7600 transceiver. The LDG tuner consistently shows higher SWR readings than the radio's internal SWR meter. Why the difference? And... which should I trust? Thanks, Dan O'Connell/KC2TRX.

Hello Dan,

Please provide more details. What is the radio and tuner reading? It may all be within tolerance (+/- 10%).

Normally, the radio is the one to go by, but the tuner can still provide valuable information as well.

How do I determine tolerance (+/- 10%) with SWR? I can understand with power, etc. My AT200Pro does the same thing. If the AT200 reads 1:1 SWR and the radio reads 1.5:1 SWR, how do I determine tolerance?

Hello Dwayne: I'm using the AT 100 ProII with a Transworld vertical dipole. The typical SWR readings on 20 meters are around 1.3 on the ICOM 7600, and 1.7/1.8 on the AT 100. Not a big deal, but I'm curious about the variation. Thanks, Dan O'Connell.

4605. Cross-meter for AT-200Pro?

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: doc@kd4e.com
Topic: 4605 Message: 4605

The AT-200Pro has it all over the MFJ-993B; 160-6m vs
160-10m, sleeker look and size, and it's LDG! ;-)

The one thing I miss is an analog meter. Is there a
way that a cross-needle analog meter could be tapped
into it?

Hi Bob,

Just vary the RF power in the SWR formula by +/-10% and see what you get.

Hello Dan,

Sounds like the control for the reverse reading is off a little. It's a simple adjustment on the inside. Just turn down the pot that is marked for the Rev so it reads closer to your radio.

Dwayne: Tried adjusting the pot - only one I could see, but not marked - and was able to bring the Transceiver and AT 100 readings closer, but still some variations in the readings: 1.2 vs. 1.5. Perhaps just the nature of the beast. Thanks, Dan O.

Ok, now I understand. I would just like to have the SWR meter in the radio and the AT-200Pro read about the same. Despite this "problem" I love the tuner. I did have to adjust the wattmeter indication to agree with my Bird. It was indicating 80 watts at a true 100 Watts into a 50 ohm dummy load.

The reflected adjustment pot in the tuner is completely clockwise and doesn't allow any other adjustment.

Hi Bob,

The reason I am asking is that you may or may not know that the Bird 43 wattmeter has an accuracy of + or - 5% of full scale. That means if you are using a 100 watt slug and you are measuring 50 watts, the actual power could be between 45 and 55 watts. A better choice would be a 50H slug, but I know I couldn't afford to have all the possible slugs. Those who use a Bird wattmeter have to keep this in mind. If you had been using a 500H slug, the actual power could have been between 25 and 75 watts. Using the 100H for testing reverse power of a 50 watt signal will usually give useless readings.

The Bird 43 seems to have become the "gold standard" among hams for reading RF power. What many people don't realize is the + or - 5% full scale accuracy rating. It's not 5% of what you are reading, but 5% of the full scale rating. Also, Bird recommended that you always kept your reading in the top 1/3 of the meter scale. If you fell below 1/3 you were suppose to use the next smallest slug. This make for a large assortment of slugs being carried around on service calls. Some techs even had a separate case just for the slugs.

If you use the Bird 43 properly it can be a great tool. Used improperly it can be very misleading. I like the Telewave Model 44A broadband wattmeter for work between 20 to 1000MHz. No slugs.

I understand the accuracy of the Bird Wattmeter, it's the swr discrepancy between the LDG and the swr (reflected power). I indicate virtually 0 reflected power on the Bird and 1.8 on the LDG. This is about the same using 100 watts forward power. I guess what I want to know is, how can I get the 2 to agree more closely? Or does it really matter?

From: Ken
Topic: 4601 Message: 4619

I am not surprised at all that the radio's SWR reading is different. This has been beaten to death... but the question keeps coming up on various different lists.. The answer is.. don't expect the same reading on both meters.. nothing wrong with the meters.. If you do get the same reading it means that you have just the right length of cable between the radio and meter.

The basics of it is that you can not compare the SWR meter reading unless they are both taken at the very same place in the transmission line (same cables etc).. Any cable and connectors added by inserting an antenna tuner or SWR meter will change the match at the radio.

SWR exists on your transmission line in lumps so to speak.. Like the sine wave on a 60 cycle ac power line, there are peaks and valleys. Depending at which point on the transmission line you insert a meter, you will see different SWR readings. This is why you can make an antenna with a high SWR work, by changing the cable length. You change the radio's electrical position on the transmission with a lower SWR.

As a test to see how this this works, try inserting various length of coax before your tuner. You should see differences in the SWR at the radio.. My TS-590 will not tune my antenna if I have a patch cable and antenna switch in line.. it sees the SWR as too high to tune. Remove this and it works just fine, no problem tuning the same antenna. There is no problem with my LDG tuner as it is after switch.

If you can grasp this concept you will no longer worry about the meters matching. The radio meter is showing the match between it and the tuner while the other meter is showing the match between the tuner and the antenna. What is important is what the radio sees and that is closest to the reading on the internal meter. The bottom line is if the radio is happy, that what matters.

If you study this more you will find that having a 1:1 match may not always good. There is a lot more to this... too much for this post. There are many good books on the subject but a lot of them get very technical and loose many readers fast... I have written on subject but can't find what I want at this moment. I guess it's time to get some of this stuff together and put it up on my website so I don't end up trying to remember and have to type it out .. hi..

I agree. The only twist to this is that he said the testing was done with a dummy load. Something strange is going on. If the VSWR to the 50 ohm dummy load is 1:1 there should be no difference in measurement along the transmission line. This does not appear to be true. Either the tuner is faulty or the test procedure is faulty.

If he had a VSWR of 1.8 to 1 showing on the tuner that would equate to about 8 watts reflected power. My point was that the Bird would be inaccurate if he used the 100 watt slug to read 8 watts.

Dan, if you put the tuner in the bypass mode with the dummy load does it still read a VSWR of 1.8:1? (I don't know if the tuner will read VSWR in bypass mode).

4621. AT-11MP

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-02-04 17:59:27 UTC
From: k4mt
Topic: 1557 Message: 4621

I just got my hands on an AT-11MP that was not working properly. It tuned for max rather than min SWR. Found diodes that detect forward and reflected power read the same bot directions with my diode tester. Easy fix and the tuner works fine now. I searched this group but did not find the answer to my question.

Is there a schematic available anywhere for these tuners? I have googled and not found one.

Thanks,

Gary K4MT

Hi,

I see the discontinued AT200PC antenna tuners for sale at some websites.

Are these made exactly the same as they were a few years ago?

Or are there any improvements?

Howard

Wes,

The ARRL did some tests years ago, but much to our opposition, they did not include any "real world" loads. That's fine, because that was that was the only method that they had that would fairly compare units that were advertising with them.

In the real world, the switched L network (like LDG and Ten-Tec) is the most efficient tuner that there is. It only has one tuning solution and it has one third less components (which is less component loss than PI or T tuners).

Since the ARRL has to be "non-negative" to it's advertisers, you will never see a properly done test.

Wes,
I scanned the review listing at the ARRL site and didn't see a specific review for the Z-11pro. Typically when these are done, several tuners are compared and power losses measured under various miss matched conditions. As a result, you get a sense of the tuner range and overall efficiency. The review listing is current through 2009 - so stuff published over the last year is not yet on-line, although I don't specifically recall a Z-11 review.

Date: 2011-02-16 08:43:08 UTC
From: k4mt
Topic: 4635 Message: 4635

I just got the upgrade chip for my AT-11MP. All I can say is WOW what a difference. This makes the tuner a pleasure to operate with almost instant tuning due to the memories added by the upgrade. When I change bands all I have to do is say the first word on SSB and the tuner makes one click and I am tuned.

Well worth the money.

What you need is the Y-OTT which has been discontinued. See near the bottom of this web page:
http://www.universal-radio.com/catalog/hamtune/2050.html.
<http://www.universal-radio.com/catalog/hamtune/2050.html>
You may be able to find a used one on Ebay, but I think there is some intelligence in that device that you might not be able to duplicate.
Search the LDG site for discontinued manuals/schematics.

I have one and love it. AT-11MP, Y-OTT and 857D.

Jim.

Date: 2011-02-24 02:40:45 UTC
From: Art
Topic: 4643 Message: 4643

I hooked up my IC706 { original } to the LDG at-7000 and my antenna coax,and the at-7000 will tune 75 to 10 meters as described in th manual. I connected a pair of six meters { 58" } wires to the same antenna system and nothing happens. what am I doing wrong ?
The at-7000 circuit board says "version 1.1" but no designation for version on any of the plug-in moduals.
thanks,
Art

Hello David,

The GDT will be available from www.cheapham.com. There are a half dozen different types of lightning protection. This one is a tube filled with gas that arcs to ground when the voltage goes over a specified amount.

Art,

Icom has the firmware in the radio programmed not to send a tune command when on 6M. There is no way around it that we know of. The MKII and MKIIG models will send a tune command on 6M.

Hello

Any help greatly appreciated. I purchased a 100-pro that had been removed from the case and was going to be in an amp for the input. I am mounting it back in the case and need to know where the two antenna connections mount back onto the PC. I cannot fine a schematic or a photo on line to work from.

Thanks for anyone who might be able to help.

Randy/n4jzy

Thank you Dwayne!

Good to know that the product may be sustained over time, barring
a near-strike from lightning which would destroy the housing.

Recently purchased a IC7000 to replace an IC718.
Can I assume the the cables supplied with the Z100 for the IC718 are suitable for the IC7000?
I assume that the connection to a Z100 will not compromise the temperature monitoring circuit of the IC7000 as can happen with other auto-tuners?

4650. IC7000 and Z100

I have recently had my IC7k replaced under warranty because it went up in smoke. Using the new
unit on CW full power with a LDG Z100 the temp display goes into the red. Being concerned I 'Googled' the issue and found that with some auto-tuners the IC7000 temperature circuit is compromised and over temperature readings are possible with a disastrous result.
Can anyone confirm that the Z100 is ok to use with the IC7000?

I decided to sell my AT-7000 tuner because it would not tune on six meters useing my IC-706 { original } .
My question :
other than the Z-100 operates from batteries and the IT-100 does not,will it tune six meters with my IC 706 ?
The IC 706 {original } does not transmit a tuning tone on six meters,thus this question.
Thanks,
Art

Art, with either the IT-100 or Z-100, you can key the radio in AM mode and push the tune button on the tuner for 6M tuning for the older 706.

Jack,

He may have proved it twice or maybe not. If you believe everything you read on the internet, then yes, that's the first proof. He really didn't say what he read and if it applies to LDG tuners or not.

The second one may or may not be related to the tuner. If you even partially cover the fan or the exhaust, the radio will get hot. If you key for three minutes with high duty cycle, the radio will get hot.

So cutting to the chase scene, we've never heard of anyone having issues with overheating of the IC-7000 due to an LDG tuner. So it seems unlikely that ZL4AFM is having any issues due to the tuner either.

Art,

Don Kessler is designing a new computer controlled Antenna Switch. I do not think it is for sale yet, and from the looks of it I bet it will be more expensive than the LDG DTS-4/DTS-6 models.

There are so few computer controllable coax switches available.

I find LDG's DTS-6 to be very reliable.

Howard

4665. DTS-6R question

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-03-07 18:51:39 UTC
From: K5LAD@arrl.net
Topic: 4665 Message: 4665

Dwayne --
I'm on my second DTS-6R and this one failed again during the ARRL SSB contest this weekend. I do have the DTS-6R remote also.
Suddenly during the contest, the switch stopped working --- it would not switch but stayed on position 6. Whether I used the remote or the actual unit, when I pressed any button, all 6 LEDs blinked twice, on for about a second each blink. I tried several things:
1. Unplugged remote and just used the unit - same blinks
2. Powered off the unit for several hours and replugged - same blinks
3. Tried the remote with my first DTS-6R which has different problem but still worked with the remote -- Switch one changed properly, either stand-alone or with remote.

Something has locked up the system in Switch two but I can't seem to unlock it. Is there a special command I can do with the buttons to unlock this condition? Since the schematic is not available, do you have a troubleshooting sheet available for we "troubled and shot" customers?

Thanks for your help and 73,
Jim - K5LAD

Topic: 4669 Message: 4670

I think you might want to try the tuner in the 590 as it seems to a greater range than most internal tuners, you could use the radio interface if you can find a LDG K-OTT Kenwood interface. I used one with my AT-1000Pro tuner but found I like the auto tune better.

yep..I have a 590 and the tuner in the radio tunes "almost" anything that my Z11Pro will.(the tuner in my 590 won't tune my S9 43 vert on 75/80m,but the Z11Pro does)It even tells you in the 590 manual it will/should tune a 10:1
And yes,I have remoted a Z11Pro in a waterproof box along with a
bias-t to power it

Hi David

>>> 1. Can the radio interface socket be used with a Kenwood TS-590?

No.. it will not work with the Kenwood tuner interface...
If it did I would be using mine that way.. :(

See previous discussion on this topic where I asked this question.

http://groups.yahoo.com/group/LDG-auto-tuners/message/4479

The only current LDG tuner that will support the TS-590S is the KT-100
which only supports Kenwood rigs with the AT-300 tuner (tuner interface)
connector.
http://www.ldgelectronics.com/c/252/products/1/42/1

You can still use the Z11 Pro (II) without the interface cable as it
will tune when RF is applied.

>>> 2. Anybody looked at making it a remote tuner?

I have not tried it but have read about others who have had great
success using a Z11 Pro (II)as a remote tuner. This works as the tuner
works without the need of a control cable.

Hi David.

I am using the Z11 PRO as a remote tuner at the base of my small tower with a FT450. And have used it with different radios as they come and go without any problem. Never failed and when the batteries get low it just stop tuning so I know it is time to open the box and replace them. No erratic behavior. Works better than the several times more expensive SGC I used to have.

I have a brand new AT1000pro (one week) which does not hold memory on 17-15-12 or 10 meters even after it finds its match. Each time I touch the key or speak into the mike anywhere on those bands it goes back into a full tuning cycle.

The AT1000pro works as advertized on 40-30 and 20 meters; once it tunes anywhere on those bands I can return and click, it has the proper match.

The antenna is a 40-10 OCF Carolina Windom dipole that my previus tuner, an LDG200Pro, handled without difficulty. I realize this antenna presents complex matches on certain frequenciies, but as noted the 200Pro had no difficulty tuning it from one end to the other; once it found a match the first time a touch of the paddle was all that was required

I 'upgraded' to the AT1000pro because I've purchased an AL-80B linear and needed a KW-capable tuner. The 'exciter' is an Icom 756 ProIII. However, I have not used the linear with the AT1000pro and will not until this problem is taken care of.

Any thoughts and suggestions would be greatly appreciated. Thank you.

seriously ???
Now you have no choice but to come out with a wide range,weather proof/resistant remote tuner to use at the base of the S9,right ???

goody goody...an affordable remote weather proof tuner to place at the base of my just aquired S9 43 vertical !!!

Date: 2011-03-15 15:37:17 UTC
From: Ken
Topic: 4682 Message: 4682

A discussion on the TS-590S Yahoo group says the MFJ auto tuners do not work with the interface cable. Something about the AT-300 interface not being programed in the firmware.

Has anyone tried a KT-100 tuner with the TS-590S? Is this only a problem with MFJ or is it with the LDG tuner as well?

Sounds plausable, but I do not think radios with this setting will cause a tune to occure it the tuner sees a match. Sounds (at least to me) that he picks a frequency, runs a tune cycle, an then when ever he keys up, it will try and run through a retune, even though it should already be tuned. Sounds symptomatic of RF getting into the tuner.

4687. [AT-100 Pro II] Bypass keeps staying on

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-03-15 22:30:43 UTC
From: g0nup
Topic: 4687 Message: 4687

HI All,
I'm new to the AT-100, but I seem to have a problem

I have two antenna connected, a vertical and an Inv-v. I know I can select whichever antenna I want.
I have a set of frequencies I use and I have done a full tune on them all along with tuning plus or minus a few.

When I come to actually transmit, sometimes, the first touch of RF out seems to bring up the Bypass LED on the front of the AT-100.

It can happen on either antenna. Only way I seem to be able to clear this is by stopping QSO, dropping power, pressing 'TUNE ' and letting it resync itself.

Why is this happening?

Normal (CW) power for me is 50-75W, in fact none of my rigs will actually go over 100w..
If I take the AT-100 out of circuit and use my Kenwood rig built in ATU I get a very stable SWR.

This was the reason for my previous (unanswered) question as to if there is a factory reset.

I'm just worried that something is wrong and it needs sorting or replacing?

Regards
73

Hi Howard,

No, it had nothing to do with the magazine. It's a fairly new start up company that had been selling fiberglass HF antennas under the name S9Antennas out of TX for a few years.

From: Dwayne
Topic: 4687 Message: 4690

Hi Kevin,

Auto mode take precedents over bypass, so if the tuner see an antenna that has swr higher than what is set in the threshold, it will start tuning. If the resultant tune is all tuning elements out, then it leaves the tuner in bypass.

The first thing I would do would be to turn off the Auto mode until you can get it all figured out.

Then maybe turn back on Auto mode and set the threshold to something higher like 2.0 or 2.5.

You don't need a factor reset as the tuner will take care of that for you as you find good matches. Just play with the Auto and Semi mode to find what behavior you like.

Hi Warren,

Place the tuner in semi mode. Press the Auto button and the Auto LED will go out.After that, the tuner should never retune unless you press the tune button on the tuner.

It does sounds like there is some RF getting into the tuner cause it "think" that it has a bad match and is retuning. Stray RF can do this or RF on the power cable or interface cable (if used). Some snap-on chokes make help alleviate the problem to a level that is usable for you. But adding the amp will only multiply the issues.

Try the semi mode first and that may take care of it.

Ken.

Good question. We have not tried it with the 590 yet. From what we are seeing in some of the early reports is that the tuner in the 590 is pretty good and may not have much benefit from using an external tuner.

Of course the same thing was said about the IC-703 with internal tuner when it came out (but turned out false), so until we have more data, we just don't know.

On the interface part, we'll just have to wait until we get one to see if it works or not. We've not heard either way so far.

Hi Dwayne..

Thank you for the reply.

Yes the tuner in the TS-590S is excellent, compared to the tuners built into any other radio I've owned. It will match most loads up to 10:1. The problem I found is in the way the tuner works. When you press the tune button, it quickly check the SWR. If it see a SWR of near 10:1 it will not attempt to tune. There is nothing that you can do, it just will not work.

There were situations that the tuner had worked fine on my antenna. Weeks later it would no longer tune, when I pushed the tune button. I changed to a close frequency stored in memory, with the AT turned on the rig worked fine, (without tuning) showing a match near 1:1. Next, I found if I changed to the frequency I wanted (leaving the AT on and not pressing tune) I still had a good match. I seems like the tuner checks the SWR and decides it can not tune the antenna while using stored settings it works fine.

With my LDG Z11Pro I can match antennas that the TS-590S has problems handling. The LDG tuner is more flexible in the way it works as it will try and very often tunes some very poor antennas. The thing is that the LDG tries to tune in situations where the TS-590S will not. For this reason, I am looking at using an external tuner, along with being able to use an external SWR/watt meter inline. I like the KT-100 because I could just push the tune button on the radio.. (like I am use to with my Icom rigs).

Hopefully someone will test soon to verify if the KT-100 tuner will work with the TS590S. Maybe one of your dealers to check this. If it is a Kenwood problem they can get after them and hope they can fix it soon in a firmware update. I don't want to buy a KT-100 if it won't work. I don't think your dealers want to sell the KT-100 only to have a TS590S user angry that it won't work. (Time for someone at LDG to buy a great new rig.. hi..)

I know I can use the Z11Pro without the interface cable and have now configured one of the TS-590S programmable buttons to make doing this easier. You can setup one of the PF keys so the radio switches to CW and puts out a carrier at a power level you set, from 10 to 100 watts.

My IC-703 tuner can match some broad mismatches when used with a balun. However, the Z11Pro is a lot more flexible in handling some very situations you can find in portable setups.

The tuner in the ts-590 is pretty good,however there are spots/bands that it will not tune that my Z11Pro does.

Dwayne,
Thanks for the reply, I've been testing it a bit more and I've noticed that the Bypass led is coming on whenever I change antenna.
e.g. I power up rig and at-100 and the bypass is lit, I change antenna with the button and the other antenna is also showing the Bypass led.
It is probably as you imply I need a bit more practice. I was really just after some form of reassurance that there was not a problem.

Best to use the tuner if a match was reached. The same thing that gives
better power transfer when transmitting also works on receive.

I use a Z817 with a Yaesu FT817 and I find no detriment with with left inline, unless rx on a band way off from where tuner was last tuned. For general listening I run it off line,and compare SWR with and without it. On 40 meters my antenna is a good match, it's an inverted V, the tuner makes no noticeable difference, on the windom I tend to use it on all bands except 20 meters. hope this helps!

Hi Jimmy,

Sorry for not replying sooner.
Work & recently moved QTH, not enough hours in the day.

At present I have a temp homebrew fan dipole for 17M, 10M and 6M
The 590 will match additionally on 15M, nothing else.
The Z11 will match on 20M, 15M and 12M.

Eventually I want put some a bit bigger at the end of the yard,
and put the Z11 with it.

Thanks & 73's - Dave - G8LIY

Not often that a person gets access to a true lab grade wattmeter so I thought I'd check the accuracy through comparison of my 2 AT-1000 pro tuners. Here's the question,

Is there a special procedure if an adjustment is necessary i.e. power, frequency, etc.

Is there an adjustment pot and it's location.

Thanks all

Bill - W5WDV

4704. AT-1000 and AT-1000Pro

I've been using my AT-1000 for about 5 years now after my Ameritron ALS-600 amp. I recently upgraded my base rig to a an ICOM-7600 and am considering purchasing an AT-1000Pro to get the autotuning capability versus the manually intitated tuning I have now.

I notice that the AT-1000 Pro comes with an "Icom Interface cable" . Does this work with the Icom 7600? If so where does it connect? I'm already using the 7600's USB port for rig control to my station management software.

Bottom line. How much simpler would the replacement of the AT-1000 with the AT-1000Pro make my station operation?

Thanks & 73

Gary, K2GW

4707. RF Sense Chip for AT-100Pro?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-03-30 14:11:38 UTC
From: doc@kd4e.com
Topic: 4707 Message: 4707

A Ham describes using a LDG AT-100Pro (with a "RF sense chip") between his Yaesu FT-857D and a converted commercial solid state amp.

Is that chip standard or special-order, please?

I do not see it on the LDG Web page.

4708. FT-450D Interface for AT600 Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-03-30 16:54:44 UTC
From: va6awr
Topic: 4708 Message: 4708

I have an LDG AT600 Pro that I want to use with my FT-450D. Until now I've been using the tuner with my Icom IC-736. I want to be able to use the AT600 Pro with my FT-450D in the same way (ie. press the "Tune" button on either the radio or the tuner).

I realize the YT-450 is specifically designed for use with the FT-450 but I'm using a linear amp so the YT-450 isn't an option for me. The AT600 Pro works very well for me so I don't want to buy another tuner just so I can use an LDG autotuner with my FT-450.

I want to use the Icom cable that came with the AT600 tuner and make an interface to connect to the Tuner port on the FT-450D. I want to be able to press the "Tune" button on my FT-450D or the AT600 Pro and have everything work the same way it does with my Icom IC-736.

BetterRF makes an interface exactly like the one I want to make so I know this can be done. BetterRF wants over $40.00 for their unit. I haven't seen a schematic of their unit but as far as I know they're using point to point wiring.

Here's the pinouts for the Tuner jack on the FT-450D and the Icom Tuner Connector:

FT-450D Tuner Jack Icom Tuner Connector

Pin 1 +13.8 V Out Pin 1 (Key)
Pin 2 TX Gnd Out Pin 2 (Start)
Pin 3 Gnd Pin 3 (+13.8V)
Pin 4 RXD Pin 4 (Ground)
Pin 5 TXD
Pin 6 Tuner Sense
Pin 7 Reset Out
Pin 8 TX INH In

Looking at the pinout for the LDG Icom connector, it appears the pinout connections would be as follows

FT-450D Tuner Jack Molex (Icom) Interface

Pin 1 +13.8V Pin 3 (+13.8V)
Pin 2 Tx Gnd Out n/c
Pin 3 Gnd Pin 4 (Ground)
Pin 4 RXD Pin 2 (Start)
Pin 5 TXD Pin 1 (Key)
Pin 6 Tuner Sense Pin 4 (Ground)
Pin 7 Reset Out n/c
Pin 8 TX Inh In n/c

Is this correct?

4709. Two HF Radios, one tuner & one antenna

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-03-30 08:22:19 UTC
From: blkbird777inc
Topic: 4709 Message: 4709

Hi to everyone,

I am new to amateur radio. I do a lot of 4WDing and currently have a land mobile with a tapped antenna.

I would also like to get an amateur radio to supplement the amateur bands. My aim is to replace the tapped antenna with a Antenna coupler/tuner and a new antenna to cover the frequency range of both my radios.

My questions is can I have Two HF Radios, one tuner & one antenna. I have been looking at the z11pro or the SGC 237.

My knowledge on the setup us very basic. My thoughts are to have a co-ax switch connected to each radio into the tuner and then into the antenna??

Is this possible or impractical.

Would love to hear you collective thoughts

Cheers

Greg

Greg,

I have two HF radios - but I only power on ONE AT A TIME.

Their coax antenna connections go to an DAIWA coax switch, and
the output of the coax switch goes to amplifier & tuner.

So - if you have two radios and only want to POWER ON one of them at any given radio session - and you don't like moving the coax back and forth between the two radios - then you can use a Coax switch - that's what I use.

Howard

4711. A couple of small announcements for April

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-05 22:54:26 UTC
From: Dwayne
Topic: 4711 Message: 4711

This month we announce the addition of the Z-817H coming in June. It's a higher powered version of the Z-817, but allows for the integration of an HF amplifier. The extra CAT port allows direct connection to the Tokyo High Power HL-45B for automatic band selections on the amplifier. The tuner can also be used with other HF amps targeted to the QRP market such as the HF Packer amps.

The Z-817H still works with QRP radios down to 0.1 watts and is still powered from four AA batteries that will last about a year. To handle the higher power, we've changed to an all metal enclosure that measures about 7 x 5 x 1.5 (inches). It weighs about 1 pound. The Z-817H should be available in June and will have an MSRP of $159.99.

(We still need to add some photos to the web site).

The second small announcement is we're adding the RU-4:1, a 200 watt 4:1 Unun to our Balun line (Ok, now Balun and Unun line). Since we've acquired S9Antennas, we've found that we need to include an Unun with every vertical antenna to allow the maximum performance.

Unfortunately, the RU-4:1 won't be available until around June, so we're shipping the S9Antennas with a free RBA-1:1 current Balun (also known as a choke Balun) until we can get the RU-4:1s in. We'll put a certificate for a free RU-4:1 in all of the vertical antennas we ship until the Ununs come in. That way, you can get operating now with your vertical and covert to the Unun at a later date. Once the Ununs are in, every S9vXX vertical antenna will come with a free RU-4:1 Unun.

Speaking of S9Antennas, we plan on start shipping the S9v31 and S9v18 in mid-April. The S9v43's are taking longer and should start shipping in late April. We've already got a ton on back order and we're working as hard as we can to get those orders filled. The way it's going, it may late this year before anyone can purchase one directly from stock. www.cheapham.com has taken the lead and will have the first batch of 31 and 18 foot units in mid-April.

We've got some more cool announcements for mid-June, so keep watching.

4714. AT-11MP Broke?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-10 08:54:46 UTC
From: k4mt
Topic: 4714 Message: 4714

My AT-11MP does not seem to be tuning properly. My antenna reads around 2:1 without the tuner but the tuner will not tune the load on any band. It just keeps grinding and cycles over and over again and IF it stops tuning the SWR is 4:1. I tried tuning into a 50 ohm load and forcing manual tuning and it tunes fine. Also the SWR metering is correct and the internal adjustments do not help as far as I can tell.

Any ideas of what may be happening. I got the tuner at an estate sale and it has never seemed to tune right. Or is the old AT-11MP just not as efficient at tuning loads as the newer units?

Thanks,

Gary K4MT

My original AT-11 tunes just as well as my newer Z-11Pro2 with the same loads. I would suspect the wattmeter diodes in the AT-11MP, probably got hit by static..

I found the problems.

First one relay had a bad coil. It was a relay that switches in one of the larger coils with nost windings and realy killed the range of tuning. I temporarily connected another relay in its place and the tuner works fine now.

I have one one the way from LDG. Also two of the 10K sip resistor packs had bad sections. I have them on the way from Mouser.

I want to say LDG customer service is second to none! These guys are a pleasure to deal with and as a result they will have my business! Thanks LDG!

I'm curious as to how my LDG200-Pro handles a near-perfect SWR. I just put up a GAP Eagle DX vertical, and on two bands - 20 and 17 - the SWR is as close to perfect as I've ever seen. Still, the first time I fired up the rig on those bands, the '200 went through its' routine until it found a comfortable setting.

I guess my question is, why does it still need to tune if there is nothing needed?

Hi Doc,

I have the similar problem.. All my connection is ok..
Transmitting for 100watt.. and in the middle of the QSO, my tuner begin for tuning..
and high-swr detected on my FT-100D..

And now.. I can't TX more than 50 watt using the tuner.. but direct is ok..
My LDG AT-200Pro is now on-the-way to LDG service center...
I still don't have any idea about it.. wait till LDG return mine..

Hi All

I never had this problem with my AT-200 but I went to absolutely over the top levels of effort cross grounding every panel and the exhaust in the car where I used it with flat braided straps and mounting the tuner in a faraday enclosure as it was only about 3 feet from the antenna with everything being boot mounted.

The AT-1000 by the same company I had for QRO use in the house on the other hand was next to useless for exactly the problems described here. I spent hours corresponding with LDG, doing mods and changes, inserting choke baluns in all the feed lines, earthing, just the whole nine yards and could never beat it. As soon as the RF out reached 250w py she would enter endless tune cycles. In the end it was RF getting into the tuner and the only answer was to move the antenna further from the house. This is the weak spot with all the LDG stuff if it has one in my opinion.

Regards

Ari

4722. AT-897 Plus with FT-857D

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-16 02:30:17 UTC
From: kj6kqe
Topic: 4722 Message: 4722

The AT-897 Plus manual says "For the FT-857 and FT-857D, use the YT-100 tuner." is this because of packaging, (i.e. the AT-897+ bolts to the side of the FT-897D) or is there a technical reason to not use this tuner with an FT-857D. It seems to work fine....

4723. Z-11 Pro Problem.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-16 14:50:17 UTC
From: bsip_9
Topic: 4723 Message: 4723

Hi All,
Has anyone experienced the problem outlined below and found out what to do about it!!

I needed to replace the batteries in my 2 year old Z-11 Pro which has worked perfectly up until that point.

I removed the old batteries but was unable to replace them with new until a day or so later.

I now find that the tuner often "skips past" the low swr point (as observed on the front panel green/yellow leds)and continues a full search until again passing the lowest indicated swr. If I stop the search as the low swr led flashes, I can fine tune the match using the C/L up/down buttons then store that setting and all is well until a large qsy results in another full search and a repeat of the above.

After a bandchange, going back to about the frequency where a good match had previously been obtained, again results in a full search with no certainty that a match will be found.

On 80M, when/if a match is found, a qsy of around 20Khz results in another full search with, again, no certainty that a match will be found.

Also, originaly a match could be found at both ends of 80M whereas now, no match can be found at the low frequency end.

I have tried an EEprom reset which didn't help. No changes have been made to the antenna/feeder system.

Is there something else I can try??

Many thanks,
Wes

4724. Re: IC7000 and Z100

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-17 16:10:40 UTC
From: ajmarmora
Topic: 4650 Message: 4724

i believe the original poster is referring to a change in the auto-tuner interface on the IC-7000 which is discussed in this thread:

http://www.eham.net/articles/14553

Key information from the above thread:

There are two problems associated with after-market "tuner modules".

One is a hard connection (short) between pins 1 and 2 (TKEY and TSTART respectfully), then any resistor (even a large value one) paralleled with a cap (1000 uF) to pin 3 (nominal supply voltage). The reason is, this places the nominal supply voltage on a CPU pin designed for 5 vdc. While this worked with the 706 (apparently), it doesn't work with the 7000.

To wit (IC-7000), if the resistor value is low (10K or so), the fan runs full speed. As the value increases, the fans slows. If the value is over 33K or so (depending on the internal temperature), the fan stops. But.... the temperature sense circuitry is swamped by the value of the resistor. It appears (based on trial and error) that this causes the fan to come on too late for proper cooling.

Hi,

Encountered the same problem here.
While working 21MHz.
After a good match, using CW for a couple of minutes with no QSY the tuning cycle kicked in again.

Later on I found out that 2 of the toroids and their windings got hot.
Measuring with the analyser showed a low impedance with -j54 capacitive.
Appearently the tuner inefficency at these impedances heats up the coils.
The coils get hot. Change inductance and the tuner mismatches and starts retuning again.
I changed the feedline length and balun, now the tuner sees 24-j9 Ohms and everytings works like a charm. No more heat and no more retuning.

73,
Ger, pg5v.

4727. SWR indication on AT-200Pro.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-18 07:50:16 UTC
From: sentman2000
Topic: 4727 Message: 4727

Hello,

have seen similar question regarding subject on other types of tuners too.

On my AT-200Pro swr indication on the LED bar seems to bee too high.
AT-200Pro shows an SWR of say 2.5-3.0 where the standalone meter or the MFJ analyser show a SWR of abt 1.2-1.5.
Pwr indication is OK.

Is there an adjustment procedure to correct this ?

73,
Ger, pg5v.

[sorry for replying to my own post - I was unable to edit the existing posting]

Another excerpt from http://www.eham.net/articles/14553:

"Dwayne at LDG has assured me that "All LDG tuners that are capable of interfacing to an IC-7000 handles pin 1 of the Icom interface exactly the same way as the Icom AH-4."

> There are two problems associated with after-market "tuner modules".
>
> One is a hard connection (short) between pins 1 and 2 (TKEY and TSTART respectfully), then any resistor (even a large value one) paralleled with a cap (1000 uF) to pin 3 (nominal supply voltage). The reason is, this places the nominal supply voltage on a CPU pin designed for 5 vdc. While this worked with the 706 (apparently), it doesn't work with the 7000.
>
> To wit (IC-7000), if the resistor value is low (10K or so), the fan runs full speed. As the value increases, the fans slows. If the value is over 33K or so (depending on the internal temperature), the fan stops. But.... the temperature sense circuitry is swamped by the value of the resistor. It appears (based on trial and error) that this causes the fan to come on too late for proper cooling.

4729. Use of AT-100 Pro with Icom 756 Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-19 19:26:38 UTC
From: abrigno1
Topic: 4729 Message: 4729

I have been using my AT-100 Pro with my Icom 706 MKII G with great success for several years. I hook it up to radio with the interface and use the tune button on the front of the 706 to tune.

I just got a 756 Pro (plain Pro) which has an internal tuner and would like to use the external AT-100 tuner but not sure just how. I have hooked it up with the interface like the 706 and have shut off the internal autotune in the menu and I do not turn on the tune button on the front of the 756 so it stays dark. I have been tuning using the button on the front of the AT-100. I reduce power manually then hit the tune button on the AT-100. Is this the best way??? I was told that doing this cuts back the power automatically and I don't have to reduce the power manually. Also It doesn't appear that there is a way to use the button on the front of the 756 like on the 706.

Any thoughts or help would be appreciated.

My info is based on the 756Pro3 ..

I used a LDG Z11PRO on both a Icom 706MKIIG and 756Pro3 with no problems.

When a compatible tuner is connected to the tuner plug, the internal tuner is disabled on [ANT1].

The internal tuner will still work for the antenna connected to [ANT2].

The external tuner MUST BE connected to [ANT1] and should work using the radios tune button, the same as on the 706. (the radio thinks you have attached an AH-4 tuner to [ANT1])

Are you using the right antenna connector? [ANT1]?

AUTOMATIC TUNER START and PTT TUNER START should work with the LDG tuner..

Tuner (Auto Start) = ON
Tuner (PTT Start) = ON or OFF
(I like this on in case I forget to press tune)

Topic: 4729 Message: 4731

Appreciate the reply. I will check it out.

I had it hooked up on ANT 1 with the AT-100Pro. When I used the 756Pro radio tune button I saw the AT-100 tune but I also thought I heard the internal tuner try to tune so I stopped. I had the auto tune and PTT tune shut off in the 756 menu.

The manual is vague and I didn't want to damage the radio.

I have the radio out at Comteck to Kuni Okuma for check out and when I get it back I'll try again. Overall the radio appeared to be working well but it could have been a problem with the radio so I sent it to Kuni to check it over etc.

I have seen the same thing on my AT-200Pro and there is an internal pot adjustment but it doesn't seem to make any difference, at least on mine. The pot adjustment was at the stop and going in the opposite direction just made it worse. I'll be anxious to hear an answer.

I've seen it both ways; The tuner reads 1.5 or less while the swr meter on the rig reads 2.5 and I've seen it the other way around with it reading high on the tuner and perfectly low on the rig meter.

Hallo all

Some advice please. Recently pressed into service and old AT-11 (built version) ATU, which is directly tuned from the front panel of the rig. The antenna is a half size G5RV, fed with around 15m of RG213, and hung as an inverted V a few feet clear of the ridge of the house, with the apex at about 30 feet. Using an MFJ antenna analyser am getting acceptable readings mid band on both 40m (1.4:1) and 20m (1.6:1) but unacceptable readings on the other bands between 30m and 12m, but hey thats why you use an ATU. At first glance most of the other bands tune up OK with a green (<1.5)LED. On modulating the signal on several of these other bands the relays operate and the LEDS flash as the ATU attempts to keep tune with modulation. This was unexpected, and makes the setup impossible to use other than on 40, 20 and 10m as previously indicated.

Have had a look through some of the other postings here and am prepared to consider replacing the RG213 with something else if it is thought that helps.

Has anyone else seen this? Suggestions? Feel free to PM me or direct through here.

Sounds like you are getting RF back down the Coax. Put a ugly balun at
the transition point between ladder line and Coax. G5RV are noted for
putting RF on the Coax shield.

Correct. About 6 to 10 turns of rg58 on a 2 litre coke bottle size form. Or some ferrites. Anything that keeps rf off the outside of the coax.

4740. LDG AT-100Pro problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-24 21:34:47 UTC
From: kc9eci
Topic: 4740 Message: 4740

I got this off ebay a year or so ago. The guy selling it seemed to think there was an issue with the interface cable. I'm not so ure he was right. Seems to work OK most of the time, but of late it seems like it just doesn't want to tune anything. If I try a manual tune, I can press and hold L Up or L Dn or the C Up or C Dn and hear it clicking as the LED's move up or down. Should it make the clicking noise all the way through the sequence up or down? It clicks, then stops clicking, the LED's keep moving, and then will click intermittently until it gets to the top or bottom of the scale. Ideas?

4741. How To Reset an AT-897 ?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-25 18:14:35 UTC
From: jim_bowman_19
Topic: 4741 Message: 4741

It appears my AT-897 is "locked up" on requesting tune to a new frequency.

I have tested repeatedly, on multiple frequencies.
Changed Jumper Coax
Confirmed setup is correct on the FT-897.
Confirmed all cabling is correct.
FT-897 checks good on dummy load and AT-897 does pass RF through, though SWR will be high.

No relay noise noted in AT-897 (it chatters during setup in normal operation).
I get the 5 blink "no RF" signal.

Anyone have experience with this?
Suggestions for a full reset on the AT-897?

Please note this is a NON PLUS AT-897.

Tom,

That could be a lot of different things and there is no way to tell without looking at it. It could be a couple of bad relays, it could be a bad relay driver chip, it could be a bad processor chip.

Yes, it should click all the way to the top and then back to the bottom.

Jim,

The AT-897 (plain) does not have a reset other than removing DC power and then applying DC power. The 5 blinks could come from a number of places.

The Y-ACC cable may be bad. You can check the wiring to the diagram on our web site under Products, then Tuner Interface Cables, then Y-ACC.

The Y-ACC could be plugged in backwards, the red end goes to the radio.

You could also have it plugged into the wrong 1/8" jack on the radio. There are three jacks on the back of the radio and the Acc jack is the one closest to the middle of the radio (not the red one).

If all of that fails, try a full reset of the radio (in the radio's manual). Don't forget you will lose all memories when doing the reset.

You did the coax jumper already, so if it's not one of these, it will need to be sent back: http://www.ldgelectronics.com/c/269/tech%20support-warranty

Dwayne

Thanks for the reply. I was starting to wonder if anyone was reading
this list. I guess I will look up the information on returning a unit
for service on the website and get it mailed off.

are you sure there is nothing wrong at the coax or antenna? Mine was acting like that. Turned it was because I was stupid enough to put some loc tite on the antenna. LOL!

4746. Re: How To Reset an AT-897 ?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-04-27 03:39:53 UTC
From: jim_bowman_19
Topic: 4741 Message: 4746

Problem resolved...
First to Will 2E0WHN.
THANK YOU for firmly toggling me to post me in the LDG users site.
I posted here, then a few minutes later dropped a note to LDG on their website.

Two hours later a tech contacted me at my office, patiently made me write several things down and told me to let him know the results.

Let me point out, LDG seems bent on customer service. I was stunned at the candor, patience and depth of input from them.

Oh if my iPhone service provider acted a 10th this interested.

Now for solutions:
HARD reset of FT-897 actually cured this
BUT, make sure on the non plus model:
RED stereo plug to FT-897 ACC
Black Stereo plug to AT-897 OTT
(note that one has hot tip, the other hot sleeve. if you reverse these two you are dead in the water.)

Make sure the FT-897 CAT jack has the ROUND shaped connector
The "D" shaped connector goes to the AT-897 CAT IN

Now, let me remind you, in case it isn't clear, I'll be buying LDG products every chance I get

4747. Yaesu FT-950 and RT-11 Remote

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-05-01 23:49:19 UTC
From: losttoy2000
Topic: 4747 Message: 4747

Hi,

I have a Yaesu FT-950 and bought a used RT-11 auto-tuner with remote. Wondering how to connect FT-950's 8-pin tuner out to RT-11 remote's stereo-like input? Which three of the 8 pins go to RT-11 and in what order?

Thanks.

I got in a hurry when installing the IC-706 and Z-100 in my vehical and pluged the antenna coax into the radio connector and the radio conncetor in the antenna. Could I have damaged the Z-100 ? and if so ,can it be fixed at home ,or do I have to send it in ?
Thanks,
Art

Art,

Probably no damage was done. If it's hooked up backwards and tries to tune, it will simply find the "worst" SWR. In that case the radio would fold back the RF power to it's lowest level to protect its self.

Turn it around and try it the correct way and it will probably work fine.

4751. LDG AT-600Pro - Really Noisy

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-05-09 01:17:17 UTC
From: doc@kd4e.com
Topic: 4751 Message: 4751

Should my AT-600Pro really sound like a coffee grinder
when it is tuning a new band/frequency?

I don't recall other units I have owned in the past
being quite this loud. Is it because of the power-
handling capacity or should I be concerned?

I bought this unit used.

4752. AT-1000PRO in remote position?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-05-06 15:59:25 UTC
From: Rob
Topic: 4752 Message: 4752

I've just joined this group.

At present I use a cg5000 remote auto atu at the end of my garden to feed a 40m end fed wire.

Could I fit an AT-1000PRO in a weather box on the end of a 30m length of coax with mains supplied?

I think this combination would handle more power than the cg5000

Replies much appreciated

OK re. larger relays = louder noise.

Felt pads under the feet, between the tuner and rig on top
of it, and perhaps some sound-deadening material inside
the case may help?

Perhaps it is functioning as a speaker, transmitting the noise
into solid surfaces around it?

Is there a way to mount the relays on felt pads and to enclose
the relay section of the tuner with sound-deadening material?

Is heat management a problem?

Hear if what I do/did with my AT-200Pro and the AT 1000Pro
Pick a time when the band you would like to tune is dead I.E. 15 meter at night.
Pick the antenna you are going to use,
Now pick a spot on the band your going to work.
Let the tuner tune at that spot. Move up the band a ways so that the tuner will need to tune again and let the tuner fund that spot as well.
Do this at several spots on each band and with each antenna you will be using.
The next time you tune there is is just a click away.
simple and so fast you will hardly even know it tuned.
Hope this helps.
It works great and saves so much time when your chasing a contact.

I see a ldg at-200pro-II advertised at HRO. How does that differ from the ldg at-200pro?

4771. Re: ldg at-200pro II

From: mlicht103
Topic: 4770 Message: 4771

I did some searching and found..."The AT-200ProII is nearly identical to the AT-200Pro, but adds an LED for determining when the tuner is in bypass and another LED to tell the antenna selection." So basically it is the same tuner with 2 more LEDs. 73 Mike KF6KXG

Thanks for the reply. I see that LDG website now has the AT-ProII on their website. I plan on using this with an Icom IC-7000, over the IT-100 because I just like having indicators that show me the SWR and Power reading. I believe the AT-ProII will be able to draw power from the IC-7000, and should tune using the IC-7000 tune button. Am I right on these assumptions?

4773. YT-450 CAT Problems

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-05-25 03:44:19 UTC
From: Brian
Topic: 4773 Message: 4773

My FT-950 works under CAT control with pretty much any program (PCC-950, HRD, etc.) but when the YT-450 is inserted bewteen the two (serial interface) the CAT porgrams all work very poorly or not at all. My setting are CAT BPS: 384H, CAT TOT: 100, CAT RTS: on.

Also sometimes after tuning, the FT-950 doesn't return to the same mode.

I purchased the FT-950 and the YT-450 new from HRO in the last three months.

Any ideas?

Brian

I ran a 200Pro for about a year with my IC7000 without issue. It does work exactly as you have indicated, the only reason I'm not still using it is because I added an amplifier to the station and needed more power handling capacity. That being said, when I upgraded the power, I stuck with LDG! I'm now using the LDG-1000Pro which is also a great piece of equipment. I don't believe you can go wrong with your selection. Have fun!

4775. AT-100PROII problems

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-05-29 17:18:52 UTC
From: cam55orange
Topic: 4775 Message: 4775

I may be having tuner problems or possibly antenna/feed problems. I am using a 40 meter style Windom, hung too low (20 ft') thu a 4:1 balun.

The tuner seems to be selecting High Z when Low Z is best. I can improve the SWR manually from 2:1 to a near perfect match. I also notice that the SWR reads much better on the tuner at low power (under 10 watts). As soon as I up the power retuning starts. This all seems to happen on all bands except 20m and 40m.

Does all this sound like tuner problems or is something else likely to be going on?

Also,is there a way on the AT-100PROII to retuunt to factory defaults?

Thanks,

bill - AB6OR

From: Bill
Topic: 4778 Message: 4778

I have an IT-100 that I use with my IC-706M2G and it has worked great until last week when it stopped tuning with the radio tune button. I can still get it to tune using the button on the tuner but I use this mobile and it is mounted in the rear of the car where I can't push the button on the tuner. The interface cable checks fine all the way to inside the rig. Any ideas?

I bought this tuner in August 2009 so it's still under warranty but the receipt was lost when we moved last year. Has anyone had any luck getting LDG to honor the warranty without a receipt?

4779. LDG-200PRO loss of signal

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-06-02 13:50:22 UTC
From: k2lrv
Topic: 4779 Message: 4779

Hello,

I have had an LDG-200PRO for several years, and it works perfect, well at least I thought it did. I have had it hooked up to my IC-718, and currently it is inline with an older R-7 vertical, I had always used it with a ladder line doublet through LDGs balun. I recently picked up an older TenTec Omni-D series B radio. These have a resonant tank circuit on the input that has to be adjusted to peak the receive signal. With the tuner in line, and after a quick tune, I try to peak the receive, and I cannot hear any increase in signa strength. When I power off the tuner, I can easily hear a peak by the increase noise. I have some more things to try out, like to an A/B comparison of an actual station with the tuner in line to see if there is a defference, but I am wondering is something may be wrong with my tuner. I am a pretty casual operator, and the tuner has not really been abused. Any thoughts?

Thanks,

Lou

Lou,
I'm not sure this is related but here goes.

I also have an LDG-200Pro that I purchased new within the last few months. The antenna is a G5RV jr. My radio is a Yaesu FT-950. I have an RFSpace IF-2000 board installed in the FT-950 and that is attached to an RFSpace SDR-IQ. I primarily use the RFSpace equipment for a panadaptor display.

If the SDR-IQ and it's software, Spectravue, are not turned on/operating, the LDG works fine. However, if I transmit when the SDR-IQ and Spectravue are running, the SDR-IQ shuts down and the received signal on the FT-950 drops way down, both volume and "S" units. If I then turn off the LDG, the signal goes back up to where it was. If I do a reset on the LDG, receive strength goes back to normal. Of course I then must retune.

The FT-950's internal tuner will match the antenna on some frequencies. I have found that the RFSPace and FT-950 play well together if I'm using the internal tuner and not using the LDG.

Perhaps the RFSpace equipment "loads" the LDG in a similar way to your TenTec. You might do a reset on the LDG to see if that sets things back to normal.

4781. Adapting an Z-100 to an Icom 718

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-06-04 00:04:44 UTC
From: KE5LIB
Topic: 4781 Message: 4781

Hello all.

I found this group from the LDG website. Since upgrading to General, I have bought an Icom 718 and a LDG Z-100 auto tuner. From the LDG site I was able to get a .pdf copy of its manual. It shows a photo of an Icom 706 with an adapter cable that allows the use of the Z-100. It takes the power and data from the four conductor Molex connector on the rear of the 706, passes it through a DB-9 to DB-9 mateup and terminates into the power connector, a 2.5 mm x 5 mm plug, and a stereo 1/8" for the radio interface.

While the DB-9 to DB-9 is nice, it seems a bit "longhand". The Z-100 came with its power cord, and I have a Molex plug for the radio. So, that takes 2 of the 4 terminals in the Molex out of the equation (the red and the black), and from the pic of the 706 I can figure out where the other two should go, and I have some white/green zip just for those two, like in the pic. My question is: Using white and green for the data, which connects where on a stereo 1/8" plug? Since the Molex outputs on the 706 and the 718 are the same, that's one end done.

Thanks for any help with this, and I hope I get to meet you all on the air one day soon.

73 de KE5LIB!!

Mark

Bill,

Have you tried a full reset on the radio? You will lose the memories in the radio, but sometimes that fixes strange problems.

Mark,

From the main LDG site, click products on the left side, then tuner interface cables, then IC-PAC. Then click the specifications tab. On that page will be a link to a jpg file that has the wiring information.

Dwayne,

That may be worth a try though I hate to loose the memories. And now the tuner doesn't seem to be working correctly using the front panel tune button on the tuner.

4785. Problems with KT-100 and TS-480SAT

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-06-08 11:38:57 UTC
From: dl7det
Topic: 4785 Message: 4785

Hi Everyone !

I have a problem with the combination KT-100 and TS-480SAT.
Running the whole system with a G5RV there is a strange behaviour.

Tuning runs fine - the SWR is OK => about 1:1.5 or less...

When keying the transmitter with 100 Watts, suddenly the KT-100 retunes again and then I get a SWR with about 1:3 or higher....

I think about some heavy sheath current on the coax, taking the KT-100 to retune. So I think about a current-balun with 1:1.

Will this help ?

Can I use the RBA-1:1 (current balun) ???

Thank in advance....

Greetings an 73 from Germany

DL7DET (Detlef)

Bill,

If you bought the tuner online, you may be able to get a copy of the receipt from the vendor. Also, a copy of the e-mail confirmation of the order may work.

Guten Tag, Detlef!

I had a similar problem with my KT-100 where it would go into bypass mode by itself on some bands. It was caused by RFI and I fixed it with a line isolator (coax choke) just before the tuner on the antenna feedline.

A balun might work as well, but I couldn't get to my antenna to install one, so I tried the line isolator first.

Hope you can solve the problem easily!

After being off the air for many months I decided to get back on and figure out the tuner problem. Turns out it was RFI and I fixed it with a line isolator (coax choke) on the feed line just before the tuner. The tuner works well on all bands now.

Andrew - KD5FHW

--- In LDG-auto-tuners@yahoogroups.com, "Andrew" <f41driver@...> wrote:
>
> I purchased a new KT-100 antenna tuner yesterday. I got it all hooked up properly and used it to tune across 20 meters and it worked fine. On 10 meters, however, it wouldn't tune up on a frequency my TS-2000's internal tuner can tune, instead the red "Tuning" led flashes three times after the green "SWR" led goes out. Then I tried 12 and 15 meters and it does the same thing, flashing the red "Tuning" led three times after the green "SWR" led goes out. I tried 17 meters and it seemed to tune, but then it kept trying to tune while flashing between the red "Tuning" led and the green "SWR" led. I again tuned up across 20 meters with no problem, 40 meters, no problem, 60 meters, no problem, 75 meters, no problem, but on 160 meters it will not tune any better than my internal tuner, rather blinking the red "Tuning" led twice after a tuning cycle when it cannot tune up on a frequency.
>
> Is my tuner working as designed? I've used my TS-2000's internal tuner to tune across the 28MHz portion of the 10 meter band, the entire 15 and 40 meter bands, as well as portions of 17, 20, 75 and 160 meters. The only benefit I can see from this tuner is the ability to cover the entire 20, 60 and 75 meter bands, but then I lose the ability to tune 10, 15 and 17 meters.

I bought the new AT 1000 Pro at Hamcom and found that while tuning my 110 foot dipole that if left in auto mode after tune up that it continues to try to tune when you key up. Anybody else have this problem? To solve it I tune up in auto and then switch to semi-auto and it holds the tune.

I have the AT 200 PRO as well and am going to use it at the feed point of my S-9 31 foot vertical portable on July 4th and see how it plays - well I hope! I'd be interested in any tips from those of you that have used the auto tuner portable with a vertical.

I've had that kind of problem when I was having RFI issues. Try putting
a choke balun in the feedline to stop RF on the Coax.

Thanks for the suggestion Leonard. I have one at the feedpoint of the antenna but will try another one where the coax enters the shack as well.

I have some RFI issues myself in that on 10, 20 & especially 40 meters one outlet in my shack is lousy with RF and eventually even sets off my monitored smoke detectors. Maybe another choke will help that too, we'll see.

73,

Grant

Leonard your idea fixed it - THANK YOU! I did not realize the RF was getting in on the coax. I have a choke at the antenna and after putting it on the line as it came in things got much better. I also put a toroid on the dc power for the AT 1000 as well.

I love these user groups! Now I'm hooking up QRO and we'll see what happens then.

Thanks, 73 & good DX to you!

From: knkokeefe
Topic: 4799 Message: 4799

I was wondering if anyone else is having costumer service problems with getting there tuner fixed. I sent a 600pro to ldg over a month ago and keep getting the run around about parts even tho you can still buy them I even called HRO and they told me they did not know of any issues in ordering them from ldg. Any help on how to rattle there tree to get my tuner back would be appreciated.

Kevin

4800. KT-100 use with other radios

Yahoo group: LDG-auto-tuners (2010 — 2017)

W5XJ,

The only affordable remote tuner in a weatherproof box that I have read about is the MFJ-927. Rated 200 watts, 0 to 24jH, and 0 to 3900pF. Claims to handle 6 to 1600 ohms - SWR of up to 32:1.

DXEngineering.com sells this MFJ model.

Of course MFJ does not have such a good reputation as LDG has.

Now that LDG sells vertical antennas, LDG will probably move in the direction of providing a similar antenna tuner - at least that is what I think.

Howard

I ordered a LDG Z11proII 100w auto tuner which I plan to put in a waterproof box from homedepot at my S9 v31 antenna, and power it with 6 AA batteries. I have heard this works pretty well. It'll probably be a somewhat big box, to be able to fit it in there. I wish it was weather-proofed to begin with.

I 2nd your request for a weatherproof tuner.
I'd be one of the 1st in line to buy one ;)

yeah,,I have an SG-230..that's not the point.(and I'm not overly impressed with the SGC either,I also had the 239 and 237 couplers)
The SGC line is just too much $$$..I can remote my LDG Z11Pro and it tunes everything with a Balun Designs unun,and without.I think our point is we wish for an AFFORDABLE remote,weather proof coupler such as the old RT11(?).
MFJ has a couple of remote couplers.I have not had either of those,but they are another possibility that are cheaper than the SGC.

If you do that, you will have to consider that the humidity in the box may condense out on cold nights which of course will be bad for the electronics. You may want to put in the pink=wet / blue=dry indicating Silica Gel and bake it out periodically to keep the dew point in the sealed box low.

Interesting subject. Last year, we had a problem with a commercial
tower mounted amplifier for a 900MHz telemetry system getting moisture
in the sealed cabinet. The TMA was mounted inside a steel water tank
that was very humid in the summer. The $11,000 TMA was getting moisture
on the circuit boards, even though the seal around the case was good.
The manufacturer instructed us to drill an 1/8 inch hole in the bottom
of the cabinet. We didn't have too much faith in this fix, but decided
to do it because the warranty would not be void

I have the Z-11 pro and the SGC-237. The 237 works better, it is my truck and is waterproof.
The Z-11 is in my house were it is supposed to be.
I also have a MAC-200. A lot more antenna selections and do-dads.
I buy a tuner for what it is designed for and not try to make it think it is something else.
Worrying about $$$ can screw up reasoning.

yeah,,I have an SG-230..that's not the point.(and I'm not overly impressed with the SGC either,I also had the 239 and 237 couplers)
The SGC line is just too much $$$..I can remote my LDG Z11Pro and it tunes everything with a Balun Designs unun,and without.I think our point is we wish for an AFFORDABLE remote,weather proof coupler such as the old RT11(?).
MFJ has a couple of remote couplers.I have not had either of those,but they are another possibility that are cheaper than the SGC.

Hi All,

I'd guess that if LDG thought there was a good market for a waterproof AutoAtu then they would make one so, all those who want one should tell them so!
Until then, as well as the risk from condensation consider extremes of temperature, both high and low. For what it's worth, to protect active electronic equipment out of doors, I have used a good quality high-volume cool-box or "esky" as they're sometimes called. These will give a fair measure of protection against both high and low extremes of temperature and the high-volume permits the inclusion of large amounts of silica gel to take care of condensation. Just be sure to make cable/feeder holes a really tight fit then further protect with BlueTack etc.

Try it until LDG release the $500 equivalent!

73,
Wes.

Yes i have checked out others and SGC is mighty fine. I just bought the AT 1000 Pro so i am tapped out but if i find a good used SGC I will buy it. I hear they are great for tuning massive loops like the one i built for 160M.

73,

Grant

From: ve3wmb
Topic: 4815 Message: 4817

I posted some photos of my waterproofing solution to this group a while back.

Look in the "Photos" section of this group in the folder titled "VE3WMB waterproof tuner box".

The tuner is an original LDG QRP tuner which I leave in "Auto" mode and power remotely from the shack via a small 12V supply, with the power leads fused at the power supply. The antenna it is connected to is a sloping 30m delta loop, fed with about 8 feet of homebrew open wire line and connected to an LDG 4:1 balun, and then to the tuner via a short coax jumper.

The waterproof box is a GSI Lexan Camping box. This is my second one (the seal on the first one went sort of gummy after a few years). Previous to that I used a common food storage container, only to realize after about a year that most of the container was made of polypropylene and it literally crumbled in my hands.

My solution to the "water/moisture" problem is to keep all of the connection on the bottom of the box and to leave a small drain hole to allow any trapped moisture a means of escape. Gravity keeps the water out.

I have had this setup on the side fence in my back yard continuously for at least 5 years. I periodically open the box and the tuner itself to check for any moisture damage and I have found the internals to be free from any hint of moisture damage.

Our climate in Ottawa varies from 30C+ degrees with high humidity in the peak of summer to a few days in winter when the mercury dips below - 30C degrees. This is a testament to the reliability of the LDG tuners.

4818. Selling My Gear, Including a Z-11Pro Ultra

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-07-14 16:50:38 UTC
From: kf4jzy
Topic: 4818 Message: 4818

Hi Group,
Since I moved from Florida to go to school in North Carolina, I have not setup any of my equipment in my apartment. So, instead of it gathering dust, I am looking to sell it.

I have a used LDG Z-11Pro Ultra Autotuner I am selling for $130 shipped. I am also including a used LDG RBA 1:1 balun.

This autotuner has been used inside only; no mobile use. I purchased this new and am original owner (non-smoker). It is in excellent condition and comes with the box, manual, radio cables, and power cable (you will need coax and batteries, if you want to use it battery powered). I used this with an Icom IC-718 (also for sale).

I will only accept Paypal and USPS money orders; the autotuner will ship when payment has cleared, and I will provide buyer with delivery confirmation information. I will double box the autotuner as well. The autotuner is in fine working condition, but will be sold as-is without any warranty.

I have other gear for sale as well, but I'm not sure if I can post that in this forum. If I can let me know, or let me know if you want me to send a listing of the other stuff I have via email.

Thanks,
Brent, KF4JZY

Sure,

Here ya go.

*
*

Ham Radio Gear For Sale

Icom IC-718 - $450.00 shipped

*
*

Palstar ZM-30 *Antenna Analyzer* - $250.00 shipped

*
*

Pelican 1600 Case (has a Yaesu sticker on it, this was used to store radio gear, but I still have all the foam, so foam can be reattached with toothpicks or glue and customized to suit your needs) - $100 shipped

*
*

Samlex SEC-1223 23 Amp Switching Power Supply (has 3 holes on top of enclosure; I mounted a mobile rig to the top) - $75 shipped, and I will throw in a 4-way Powerpole Splitter

*
*

Tracker2 model OT2m APRS Tracker/Digital Interface/Digipeater (no cables included except for a power cable; will need cables based on use, see https://www.argentdata.com/catalog/product_info.php?cPath=22&products_id=73) - $70 shipped

*
*

AES PK-232MBX (for Packet and other digital modes; comes with manual, an interface cable, and a serial cable; no box) - $60 shipped

*
*

Radio Shack Pro-60 Analog scanner ? covers 30-1000MHz minus cellular and some UHF Television channels; 200 channel capacity in 10 banks; triple

conversion circuitry; not a trunking scanner. Includes rechargeable battery pack (unknown condition), desktop charger, battery case for alkaline or rechargeable batteries, antenna (not original), wall charger, and manual, no box. - $60 shipped

*
*

Yaesu VX-150 2m HT (with 2 batteries and charger, can?t find manual yet, no box) - $55 shipped

*
*

Donner?s Digital Interface with USB Sound Card (Wired for Icom rigs with Din-13 connector, but it can work with any rig by simply creating a pigtail with appropriate connector for your rig) - $35 shipped

*
*

Arrow OSJ 146/440 2m/70cm J-Pole Antenna - $28 shipped

*
*

LMR-400 Cable (Will have to measure, but 2 sections around 30?) - $25 shipped/each

That is a nice setup you made. I heard of a ham that uses picnic coolers for larger gear with good success since they are UV protected and insulated that helps with the heat here in Texas or the cold up north.

Hi
My name is Rob, and my call is K4MAU. A few days ago, I think it was Monday, I joined this group. Afterwards I posted about a problem with my AT-11MP. I understand that my membership was waiting approval. As of today my post still hasn't shown up, and I'm wondering what my mistake was, and what do I need to do to correct it. I look forward to participating in this group, and do need some help with my tuner.
Thanks
Rob K4MAU

I have used my IT-100 with other radios. I just got a connector from Mouser and wired it up per the instructions in the manual. It's not automatic but all I have to do is transmit 10 watts from the rig and push the tune button on the tuner.

It's usually a result of someone's account being compromised. We delete the spam from the archive, notify the offender and place their account on moderated until the problem is resolved.

It does not happen very often and only takes a day or two to resolve.

4835. AT-11MP Problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-07-14 15:01:09 UTC
From: k4mau
Topic: 4835 Message: 4835

Hello to the group.
My name is Rob, and I've been an active ham for 11 years. I have a fair amount of home brewing experience, as well as some radio repair experience. I recently picked up a used AT-11MP tuner. I brought it home and checked it out. What it is doing is, when it tunes it will find a match but, the match is wrong. In other words when it tunes its self the radio will see a high swr, about 2.5 to 1. If I manually adjust it I can make a good match for the radio, and then the meter in the AT-11 will read 2.5 to 1(or so). I changed coax jumpers, put it on a good dummy load and a good antenna. In bypass the radio sees the dummy load as good, and the antenna as it normally does such as 1.5 to 1. If I activate the tuner and feed a 10 watt or so carrier in, the tuner will click away and settle on a match that its meter reads as 1.2 or so. But then the radio will see 2.5 or so. Again I can manually change the tune and make a good match for the radio, and then the tuner's meter will read 2.5 or so. Changing coaxes , loads, and varying the power level, and the results are the same. If I tune in to a ggod load or a mismatch, again the result are the same. I have tried adjusting the forward, and reverse pots and still when the tuner tunes, the radio get a mismatch. Its as if the tuner is trying to present something other than 50 ohms to the transmitter. Any ideas? If possible I would really rather repair it myself as opposed to sending it in for service. I'm capable of doing the work, but am looking for a little help in finding the trouble. Once its fixed I would like to do the chip upgrade. Any thoughts are greatly appreciated.
Thanks
Rob K4MAU

Rob,

The LDG products are great pieces of equipment but they are sensitive to anything that might not be perfect in your station. Usually, when you see problems such as this, my experience is that RF is somehow getting back into the unit. This plays out as the first thing I would look for since the dummy load is reading/tuning fine. I own 5 LDG ATU's and it always comes back to RF. A combo of air core chokes, beads, and ferrite cores has ALWAYS solved the problem and resulted in proper operation. Hopefully you can find the "leak" and resolve yours too. So, again, this is the first place to look in my opinion. As you already know, RF can be very sneaky.... even though you may be reading perfect SWR, it can find a way to get back into the component and make you crazy trying to get it out.

Good Luck,
Bill - W5WDV

4837. Z-100 Plus Problem - Need Help !!

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-07-20 06:10:14 UTC
From: ja0por
Topic: 4837 Message: 4837

Hi to all,

Recently Ive purchased the LDG tuner Z-100Plus
(My 2nd LDG tuner after Z-11Pro)

Its been working fine for about a month since received but
now not functioning at all.

Setup:
Radio used :IC-7200 with Icom cable supplied
RF power : less than 50w - mostly 10 to 20 w
Antenna used : End Fed Antenna SWR <2.5:1

Symptom:

It would not tune and even the LEDs not light.

First I was trying to toggle Bypass Mode but in vain
Noticed the DC voltage at the power jack will be dropped when
press the "Tune" button and the voltage stays there (around 5VDC with 12VDC input)
It came back to 12VDC only by cylcling the power.

Before sending it back to the LDG for repair under warranty
I wonder if there is something to check more for me ??

Any suggestions/thoughts will be much appreciated.

Great advice Jerry,

A long, long time ago, LDG used to use 1N4148 diodes in the SWR sensor. They worked fine, but are susceptible to static discharge and nearby lightning strikes. For the past 10 years, we've use the 1N34Aa with a much better low voltage detect and a higher PIV.

Anytime we get a unit in for repair, one of first things we look for is to put in 1N34As.

Hi all
Thanks for all the suggestions. I was suspect of the diodes. One of them tests different. I wasn't sure due to testing them still on the board. I don't have any 1N34A diodes, but I have some marked 1N914/1N4148. Are these ok to replace the one that seems to test diferent? If this solves the problem I will order some 1N34As and replace both the forward and reverse diodes.
Thanks all
Rob K4MAU

Hi all.
In regards to the diode, perhaps this would be a better substitute than a germanium, as germaniums are not very hardy and not quite as common anymore. It also has a forward voltage breakdown comparable to germaniums and in all other ways superior to germaniums.

From: Dwayne
Topic: 4844 Message: 4844

Hello Folks,

We finally got the new Z-817H units out the door last week. They should be showing up on the dealers shelves any day now. These will work with any QRP radio or QRP radio with an amp of approximately 50 watts. Yes, we know some of those amps go over 50 watts on some bands, so we put a good sized buffer zone in there to handle it to about 75 watts.

There has been some confusion on the connection configuration. The FT-817D that we have and the Tokyo High Power HL-45B can both be connected with the Z-817H in line. Ours connected like this: the tuner interface cable goes to the ACC Port (CAT-Port) and the Amp interface cable went to the Data Port (Band data).

Also we got caught up with our AT-600Pro tuners this month. We had a temporary back order of certain parts that put about a month and a half delay in getting these out the door. We're all back in stock now and dealers will have those available to fill any back orders next week.

We finally got our Alinco DX-SR8T transceiver in to test with our AL-PAC Alinco interface cable and found that it does not work. It looks like Alinco made some changes to the tuner port interface on the SR8T (we have not found out exactly what yet) and it will not work with our interface cable. Not to worry though, you can still use our tuners in Auto mode and the tuner will tune when it senses the RF, SWR and frequency and determine if it needs to tune automatically. You can also key the SR8T in a carrier mode and push the tune button on the tuner to start a tuning sequence.

Lastly, we have come to a very difficult decision for our product accessories. In the 17 years of LDGs existence, we have never had a price increase on an existing product. The good news is that we intend to keep it that way for as long as we possibly can. The bad news is that the skyrocketing cost of copper wire in the past 12 months has forced us to discontinue including the optional cables with our tuners.
Rather than go through and create a price increase for every product that will last for the foreseeable future, we'll keep the tuner prices the same, but not include the coax cables with each tuner. Also our generic tuners (Z-100Plus, Z-11ProII, AT-100ProII, ect) will no longer include an Icom interface cable. You may remember that we discontinued including the Y-ACC cable with our generic tuners this past Spring.
Not to worry too much as all generic tuners will still include a DC power cable. In addition, all tuners that are "radio specific" will include the radio interface cable. For example, the IT-100 will still include the proper Icom Interface cable. Same goes for the Kenwood and Yaesu specific tuners.
The decision was already on this path as we now have five optional cables for our generic tuners and it's simply not feasible to include all optional cables with every tuner. Most dealers will be picking up several of the five optional cables this spring and of course, you can also purchase any of our optional or replacement cables at www.cheapham.com or www.w4rt.com. In addition, the wiring diagrams for our optional cables are available on our web site.

That's it for this month,

Dwayne Kincaid
LDG

I've had a similar problem with my YT-100 and FT-100 and it seems to be an issue with the CAT line, either the cable wasn't plugged in the computer or I had a loose connection on the back of the tuner. I turn on my FT-100 first then boot up the Fldigi program. Let me know if this helps.

The diodes are 1N34A germanium which have a lower initial conduction voltage than the more popular 1N4000 series silicon diodes.

Unless someone else has a better idea, I'd try to find the 1N34A type for best SWR low sensitivity.

I did a quick Google search and seems like the 1N34A is still cheaply available.

Maybe call LDG and see what they suggest if you have a concern.

If it is like the ICOM interface cable shown on the LDG web site all you need is some 4 conductor shielded cable. Cut your existing cable at the molex conductor and splice each piece to the ends of your 40' cable. I would get the largest size conductor that is practicable like 20 AWG vs. 24 or 26.

I have a LDG AT200 Pro tuner and it is advertised as being able to store settings for several antennas. They call it "3D memory". Is the AT1000 able to do that? If not the setting for one ant that you stored first might interfere with setting it for the second antenna. Did you try clearing the memory on the AT 1000 and starting from scratch? If you have an antenna analyzer, I would check things out with it. 73

Hi to all,

This is to update my problem.

In short
Nothing is wrong with the Z-100Plus itself and
found the IC-7200 could be at fault

Since no feedback on this problem so far I was about shipping it back to the LDG for repair .....

I decided to do a final check to make sure the Z-100Plus still has a problem.
First double check with the second ICOM cable which was supplied with Z-11Plus but still the same result.
Then tried with an Ext DC cable supplied (dropping the Icom cable)

Wow ! No problem !
It does tune / toggle Bypass mode as well!

So my next step is to do troubleshooting on the IC-7200.
Maybe this guy refuses to give an enough 12VDC power??

Thanks and 73s de Mano JA0POR

When you get it going take some pictures and put them on the site and tell us about the enclosure you used. I have used a cooler when portable with my IC 706 MK II G and a 31 foot vertical but it is not 100% weatherproof. i hope it works out well for you.

4858. Z-11 Pro II Memory Scheme

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-08-07 12:15:44 UTC
From: n1hy
Topic: 4858 Message: 4858

Hello,

I have an original LDG Z-100 auto tuner and I am looking into getting another LDG tuner, the Z-11 Pro II, however I have a question:

The original Z-11 Pro specs used to say it used a "3-D Memory Array" such that 4 banks were used for each frequency to record up to 4 different LC values per frequency, i.e. store values for up to 4 different antennas for the same frequency, for a total of 8000 memories.

The Z-11 Pro II, on the other hand, no longer talks about "3-D Memory" and says it has a total of 2000 memories and the tuner comparison chart says "# of banks = 1".

Is the Z-11 Pro II now using a different memory storage scheme compared to the older Z-11 Pro? If so, how does it treat storing/retrieving memory values when using more than one antenna on the same frequency, for example, when multiple antennas are hooked to an antenna switch?

Thanks,

-- Richard, N1HY

Hi Murf,

I was quoted a turn-round time of 2 to 3 weeks after they had received the faulty unit but to date, I have been waiting for 5 weeks and still no news!

To be fair, I was advised that repairs are carried out in rotation as faulty items are received and that LDG does not have a dedicated repair technician.
There are no other repair centres.
Regards,
Wes

Hi Murf,

I've sent my LDG AT-200Pro for repair before.
Take's about couple of weeks before they return mine's.
Thank god it's still under warranty.
If I'm not mistaken, they will charge from $35 ++ for non-warranty repair.
Please go and check their site http://www.ldgelectronics.com/c/269/tech-support-warranty

Try the other antenna port on the back. It's probably the one that is connected straight through when the tuner is off.

Hi everyone,

I would certainly buy such a beast if it were reasonably priced and agree with others that it should be powered by batteries. Also, since many will want to drive short verticals directly with the resultant low R and high reactance's,(e.g. on 80/160M,)the ATU should be designed to be as efficient as is possible with large diameter torroids etc.

An interesting challenge to the designers to meet both cost and efficiency targets!!

4874. Remote tune dipole

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-08-24 01:53:47 UTC
From: Ford Peterson
Topic: 4874 Message: 4874

I☐ve been playing around with my LDG-100Pro tuner and a short 80M dipole using a remote configuration.

My goal is to make a 75M-80M dipole that tunes using the tuner mounted at the feed point of the dipole. Starting with two collapsible 12☐ long fiberglass poles, I☐ve added 4☐ stainless whips to the end. So the end-to-end fixture is about 32☐. That☐s 1/4wL on 40M and about 1/8wL on 80M. It☐s pretty short. So I did some modeling using www.nec2go.com and found that the system would resonate at about 20 ohms with a load of 106uH mounted 9☐ from the center. I fabricated a load of 106uH and mounted one of them at the proper point on each ½ of the dipole. www.n0fp.com It☐s very narrow of course. The Q of the inductor(s) is pushing 600. 2:1 SWR points after matching are only +/- 15KHz. That☐s the reason for the autotuner right?

So I built a DC bias-T, mounted the tuner and T into an enclosure and mounted it at the center of the dipole. The Bias-T was checked that out so that it handles 1A and is over 36K of isolation. E.g. 0.27uF and 1650uH choke.

After mounting, running DC power, and screwing around with the setup menus, the tuner will get a match of about 2.5 : 1 and stop tuning. It really needs to search to find the match on 75-80M. I hear the relays clacking for maybe 10 seconds or more. I☐m testing at about 10W of power. It will not hold the match. Key up, and then key down again and off she goes searching for a illusive match. I☐m pretty sure it is because I☐m not finding a good 50 ohm match and it stops tuning at the best match. Key up and the cycle repeats.

I☐ve tried running a DC cord outside the feedline and the performance is identical. So even with the Bias-T out of the equation, I☐m still getting this poor match and cycling problem.

I☐d love to buy a clue. This is just a dipole! It can☐t be that tough! I do have a current balun on the input and the output. But they are 1:1 and shouldn☐t represent a problem to the tuner.

I☐ll do a blog posting with pictures if I can get this to work.

Thanks for the help.

73

Sounds like you may be having RFI issues. Try a rf choke on the antenna side feed line.

4877. RE: [LDG-auto-tuners] Remote tune dipole

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-08-24 14:31:36 UTC
From: Ford Peterson
Topic: 4874 Message: 4877

I have been using a current balun on the output side (port 1). It's a pair of type 43 beads with about 6 turns through the cores. The input back to the rig is also on a current balun using 4 of the same beads with about 6 turns of RG58 through the cores.

Question about the specs on this AT-100PRO tuner. The specs indicate that it will match anything from 6 to 1000 ohms and with a 4:1 balun 6 to 4000. I'm used to seeing impedances stated as R,+/-j. So is this range an indication of Z? Several have told me it is a direct reference to R and not Z. Z of course is the square root of the sum of the squares of R and j. If it is an indication of Z, then the tuning range of this tuner is amazingly narrow. I've tried slewing around to find out if there is a sweet spot somewhere in the band but the same result occurs pretty much anywhere between 3.5 and 4.0MHz.

The modeling suggests about 5dB of wire losses in those loading coils. Maybe they are simply too big? (e.g. the dipole too short?) 106uH at 3.5MHz is an inductive reactance of XL=2331 ohms at 3.5MHz. That will resonate with 20pF, which is about the capacitance of that length of wire. Maybe I need to set the dipole on a step ladder, remove the tuner from the circuit, and measure to see if the XL=XC point is somewhere in the band and try using the auto-tuner there.

One other person suggested I bag 80M and move to build the 40M loads and try tuning there just to work the bugs out of it.

The output balun is likely very important. Since the shield of the SO239 connector is directly connected to 1/2 of the dipole right at the case, the case itself becomes part of the dipole but for the current balun.

I have a SGC-230 tuner mounted at the base of a 58' insulated tower powered by a similar bias-t. It's got 350' of coax back to the shack so remote tuning is a serious feature. I can tune the antenna anywhere from 1.8 to 30 MHz instantly. That tuner's specification says it will tune any wire from 1.8 to 30MHz as long as it is longer than 22' and shorter than 80'. It is not spec'ed in terms of an R or Z value. So I'm curious as to what the 6 to 1000 ohm reference in the spec is referring to.

XL=XC=1000 ohms at 3.5MHz is 45.5uH and 45.5pF.

I really wish they gave us a schematic of these tuners so we can see what the heck values they are using. Is that info available anywhere?

Sounds like you may be having RFI issues. Try a rf choke on the antenna side feed line.

The answer could be pretty simple.

Assume for a moment that you have already already matched the (low) input impedance. There is a total of 212 uH of inductance in the coils. It's a resonant circuit. To move down just 10 percent, from 4 to 3.6 MHz, you must increase the inductive reactance by 20 percent, or 42 uH. Doing it at the center, instead of half way out, you need about half that much or 21 uH -- but that's already more than the total of all the the inductors in the tuner.

And that's BEFORE you match the 20 ohms or so you are feeding.

The tuner will handle matching, plus a change about equal to the square root of the difference in inductive reactance it can manage afterwards.

You can improve things a bit by using a shunt inductor at the feed point to match 50 Ohms without the tuner. (2 or 3 uH -- experiment.) That will make more of the tuner's inductance available for QSY.

Good points! One of my frustrations with the LDG is that I don't know what the heck is in it. They don't make a schematic available. You indicate that 21uH is more than what's available. How did you know that?

I will experiment with the shunt inductor. I'm thinking I will have to build a fixture to hold the darn antenna at a point where I can put some instruments on and actually measure what's going on. There must be a solution to this. There may also be a strategy in moving it slightly below the band so that tuning out the inductive reactance uses the capacitor side of the tuner instead of the inductor side. Since the load is fixed, I can get the 'tuning' done by moving it closer and farther from the center where the load represents more-or-less significant to resonance.

Let me do some measurements and report back my findings. Unfortunately this 'work' thing is getting in the way of fun. Maybe this evening or over the weekend.

Cortland, and others...

I think I am seeking the allusive holy grail here. After doing some more modeling with www.nec2go.com I find that the darn antenna is so narrow it is virtually unusable even with the auto tuner. By placing a 1012pF capacitor across the dipole element, I can obtain a perfect match by moving the load in and out towards the tip. Tuning this for a fixed frequency would be possible. But a QSY is a major undertaking--even with an auto-tuner!

MHz Inches from center, a 1.1 : 1 or less match can be obtained by moving the load(s) to + and -
3.5 97.93"
3.6 101.69"
3.7 106.67"
3.8 111.24"
3.9 115.42"
4.0 118.76"

Unfortunately, a given match only holds for +/- 5 KHz! That's the 2:1 bandwidth point according to the model when using a Q=520. In fact, moving the coil along that line is so precise, moving it down 5KHz is now 2:1 SWR but can be tuned back to perfection by moving the coil a petty 0.200" towards the center of the dipole!

As another example, tuning to 3.750MHz I have a distance of 9.08' for an SWR or 1.07:1 with an impedance of 53 - j0.4. QSY to 3.800 and the SWR swings to 76:1 with an impedance of 1 -j42 There is no way to match that with the autotuner.

The conclusion I'm coming to here is that center loading a 32' dipole is simply unpractical at 75M/80M. Base loading may be possible but the autotuner is superfluous to the real need to either change the massive load or move it along the antenna. Doing this remotely is an anathema to me at the moment. There is no substitute for size when it comes to low frequencies!

Just got my 1000pro back from repairs...
I cant begin to tell yea how impressed I am.. they went way above
the work I requested, new coveres to replace my scratched on. New
meter.. I did not know needed work.. upgraded the SO-239' to teflon.
plus the repairs that needed done... i have never that such good
service in the ham hobby. I am in the service industry myself and
when I find good service.. I let folks know. Hope you never have
to have a unit repaired.. but if you do.. you can relax on LDG

That is the EASY question. Other tuners' L values may be a bit different, but the Z-11 schematic (for example) shows the sum of L1 through L8 is 20.5 uH.

I suspect you are giving up too soon. Loading a short antenna on 80 meters does work. It's not very efficient, but it does work. Because of the high reactance needed to resonate its capacitance, you need a correspondingly high CHANGE in inductive reactance to QSY, that's all. Incidentally, if you have a 5 KHz 2:1 SWR bandwidth, you are doing EXTREMELY well -- if that is a real antenna and not a simulation. Heh.

You can see how far a TUNER will work for QSY'ing by looking how far from the resonant frequency its SWR matching range extends to. What you NEED is an adjustable inductor, probably at the feed point, and a way to couple to the antenna there, just like a 75 meter mobile antenna.

Good luck,

Cortland

4885. Z-11 Question

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-08-27 15:09:52 UTC
From: Jack K5FSE
Topic: 4885 Message: 4885

Good evening all. I have the OTT installed on my 817, and have the Z-11 Compatability Kit from W4RT.

Somehow, I've misplaced the interface cable (item #2 from the kit)going from the back, center
of the Z-11 to the OTT Command Jack. I know it's got a 2.5mm mono plug on the
Z-11 end, and a 3.5mm plug on the OTT end, but I seem to have lost that cable. My question is: is the 3.5mm end of the plug a mono or stereo. I
was expecting it to be a mono, but the plug that comes with the OTT is a stereo.
Hmmm....

Thanks for your help.

Hi All,

I've had the same good experience with LDG. I had to send my Z11-PRO back to LDG for repair (from Spain)and,whilst it took a while before they sent it back, the way they dealt with the issue was first class.
I would recommend LDG without hesitation.

73 All,
Wes.
EA5/GW3RIH.

Cort, Jim, the LDG list...

Thanks for following the project.

Interesting day. I set the dipole on a step ladder and did some testing. By disconnecting the LDG I could sweep the dipole with my bridge. Sure enough, there was a sweet spot but it was down at 3.3MHz! Pulling turns off the loading coils one or two at a time I managed to get it to resonate (e.g. X=0) at 3.53MHz. Hoisting it back up and letting the tuner find a match was useful from 3.5 to about 3.75. I might be able to tune it up higher in the band and squeeze out a bit more bandwidth. But before butchering the coils to move it higher, what if I found a good match?

Placing a 1000pF silver mica cap across the dipole right at the feed point provided a minimum 1.07:1 SWR at 3.71MHz without any tuner. Ha! Eureka!

So I reconnected the tuner and lifted it up again. The tuner started snapping relays and finds a nice match. With the 1000pF capacitor in parallel with the antenna the LDG would get a match from about 3.650 to about 3.800MHz. At the upper end the match was fine but it occasionally would break into 'seek' mode again. So let's call it more like 3.750.

So I moved it back to the minimum SWR point of 3.710MHz and let it find a match. Then I disconnected the DC from the bias T. The 2:1 SWR points? Get this... The 2:1 SWR range without the tuner is now 3.702 to 3.719MHz! The darn thing is only 17KHz wide! The AT-100PRO extends that to about 170KHz or 180KHz with the capacitor. Without the capacitor it's useful from about 3.5 to 3.75. I had hoped for better.

This indicates a system Q of 218? 17KHz is 3710/218.24=17

Anyway, the long and the short of it is that as in all things RF, design goals compete for importance.

It is well understood that center loading is preferred over base loading. The reason is simple. 100% of the antenna current is flowing between the dipole feed point and the first load. It's current that does the radiating. Pushing full current out to the 1/2 way point has been demonstrated to radiate better.

Using high Q components reduces the wire losses, at the sacrifice of usable band width.

It was hoped that this system could be used as a horizontal 'go-to' antenna on Field Day. As such, being able to QSY anywhere on 80M would be awfully handy.

Has anybody tried this using a pair of Hamsticks (e.g. low Q) on 80M? What kind of bandwidth can be expected?

Before I write this up in my blog, I'm going to whack another couple of turns, which seems to move the system about 50KHz/turn removed. Removing turns makes the load smaller and that may have some relevance to Q. There is no substitute for tweaking. I'm also going to remove the capacitor since the bandwidth issue is important to me and the capacitor seems to be a bottle-neck.

Ford,

100% of the current does not flow from the feed point to the load else
the antenna would be 100% efficient. Current is distributed in the dipole
as a cosine wave. Zero current on the ends and max current in the center.
Since the loads make up part of the antenna and do not do any significant
radiating, your efficiency will be less than 100%. For a really short
dipole, significantly less.

Good point Jerry. Sometimes I visualize these things differently and get in trouble for the over-simplification.

I envision current radiating. More current, more radiating going on. Along the length of the wire the current is diminished due to all the radiating. At the tips, there is virtually no current and no radiating.

The coil basically does not radiate (much). So the disappearance of current in the coil is due to wire losses. A base loaded vertical does not deflect a remote field strength meter as well as a top loaded or center loaded antenna. My hope was to use center loading and the AT-100Pro to somewhat offset the poor efficiency of the short dipole on 75M-80M.

Logically we get to the same place, but use different mental gymnastics to accomplish the goal. I guess I'll keep my day job (bean counter) and leave the RF stuff to the engineers that know the lingo...

Ford,

The more metal you can get between the feed point and the coil the better the radiation. I have used 2 pieces of wire connected to my "old" Z-100. No feed line just the two wires of equal length going up to trees on either side. The Z-100 was acting as the center insulator (sitting on the table). I guess you would call this a "V" antenna. If you are looking for a portable antenna, take a look at this configuration. It is pretty simple to deploy - just 2 wires.

Thanks for the comment Jerry...

One of the design goals of this design is to make it a truly flat-top dipole. At Field day we run 2A or 2B. I'm thinking this year will be 2B. Late at night, only 80M has propagation. And the gang all moves to 75M and 80M. The trouble is the stations of the same polarity interfere when in the near field on both ends of the same band. What we have found, and successfully done for several years, is to run one horizontal and one vertical antenna. One can be on 75M while the other on 80M. That's legal on FD. We can even both operate CW or both SSB, but that's not allowed under the rules (only 1 transmitter per band). But CW and PSK is allowed and right next door with no problems. An FT450AT was observed to be within 15KHz of a PSK station and couldn't hear it. Nice!

I can see that the antenna you describe will work. There is loads of vertical radiation in that antenna and would likely overload a station connected to a vertical. For simple point-to-point ad-hoc communications, the military suggests using a single support running from a ground rod on one side to a tuner connected to a long wire supported in the middle as high as you can get it, back down to a ground level support at 6' to 8' off the ground. That too works. And way simpler than what I'm doing. Like your design, the mil design can be deployed in a few minutes.

I'm hopeful that this antenna can be used on all bands with a simple modification and that it will be a truly horizontal antenna. A Butternut vertical will be used as the vertical polarized antenna. Theory says there is 30dB attenuation between them when they are truly horizontal and vertical (perpendicular actually). Using simple radios with easy to overload front ends seems to be the norm at FD. A robust design like the FT2000D or OrionIII or FlexRadio 5000 could handle the intense fields. But IC706 class radios simply crumble under the stress.

I'm retuning the antenna this AM and have to wait out a passing rain storm to continue. Darn rain!

I've retuned the loads to get resonance at 3.680 (e.g. X=0). I've removed the loading capacitor. So the configuration is now a dipole with about 85.3uH loads at the (+/-) 9'-3" point on an element that is (+/-) 16'. The AT-100Pro tuner can find a match at 3.550 but not at 3.502. Even then it is right at 2:1 SWR. On the upper end of the band it will find a match at 3.900 but not at 3.950. The tuner will extend the bandwidth from 17KHz without any tuner to about 350KHz. Unfortunately, finding both ends of the band is not possible with this configuration.

Has anybody tried this with hamsticks?

Subject: RE: [LDG-auto-tuners] Re: Remote tune dipole

Thanks for the comment Jerry...

One of the design goals of this design is to make it a truly flat-top dipole. At Field day we run 2A or 2B. I'm thinking this year will be 2B. Late at night, only 80M has propagation. And the gang all moves to 75M and 80M. The trouble is the stations of the same polarity interfere when in the near field on both ends of the same band. What we have found, and successfully done for several years, is to run one horizontal and one vertical antenna. One can be on 75M while the other on 80M. That's legal on FD. We can even both operate CW or both SSB, but that's not allowed under the rules (only 1 transmitter per band). But CW and PSK is allowed and right next door with no problems. An FT450AT was observed to be within 15KHz of a PSK station and couldn't hear it. Nice!

I can see that the antenna you describe will work. There is loads of vertical radiation in that antenna and would likely overload a station connected to a vertical. For simple point-to-point ad-hoc communications, the military suggests using a single support running from a ground rod on one side to a tuner connected to a long wire supported in the middle as high as you can get it, back down to a ground level support at 6' to 8' off the ground. That too works. And way simpler than what I'm doing. Like your design, the mil design can be deployed in a few minutes.

I'm hopeful that this antenna can be used on all bands with a simple modification and that it will be a truly horizontal antenna. A Butternut vertical will be used as the vertical polarized antenna. Theory says there is 30dB attenuation between them when they are truly horizontal and vertical

(perpendicular actually). Using simple radios with easy to overload front ends seems to be the norm at FD. A robust design like the FT2000D or OrionIII or FlexRadio 5000 could handle the intense fields. But IC706 class radios simply crumble under the stress.

I'm retuning the antenna this AM and have to wait out a passing rain storm to continue. Darn rain!

Ford,

The more metal you can get between the feed point and the coil the better the radiation. I have used 2 pieces of wire connected to my "old" Z-100. No feed line just the two wires of equal length going up to trees on either side. The Z-100 was acting as the center insulator (sitting on the table). I guess you would call this a "V" antenna. If you are looking for a portable antenna, take a look at this configuration. It is pretty simple to deploy - just 2 wires.

Subject: RE: [LDG-auto-tuners] Re: Remote tune dipole

Good point Jerry. Sometimes I visualize these things differently and get in trouble for the over-simplification.

I envision current radiating. More current, more radiating going on. Along the length of the wire the current is diminished due to all the radiating. At the tips, there is virtually no current and no radiating.

The coil basically does not radiate (much). So the disappearance of current in the coil is due to wire losses. A base loaded vertical does not deflect a remote field strength meter as well as a top loaded or center loaded antenna. My hope was to use center loading and the AT-100Pro to somewhat offset the poor efficiency of the short dipole on 75M-80M.

Logically we get to the same place, but use different mental gymnastics to accomplish the goal. I guess I'll keep my day job (bean counter) and leave the RF stuff to the engineers that know the lingo...

Ford,

100% of the current does not flow from the feed point to the load else the antenna would be 100% efficient. Current is distributed in the dipole as a cosine wave. Zero current on the ends and max current in the center. Since the loads make up part of the antenna and do not do any significant radiating, your efficiency will be less than 100%. For a really short dipole, significantly less.

Subject: RE: [LDG-auto-tuners] Re: Remote tune dipole

..
It is well understood that center loading is preferred over base loading. The reason is simple. 100% of the antenna current is flowing between the dipole feed point and the first load. It's current that does the radiating. Pushing full current out to the 1/2 way point has been demonstrated to radiate better.

4896. I need a little input...

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-08-30 04:19:20 UTC
From: KD5SFA
Topic: 4896 Message: 4896

I have a at-100 pro that I have had for a number of years...
I use it with an IC-706mkIIg.

So I recently took a small road trip (2831 miles round trip)
and I decided that the dual bander in the car was not up to
the task of the desert and canyons of NM, CO, UT, and West TX.
Since my FT8900 is on the fritz I thought Hmmm time to pull out the icom.

So having a small car (subaru imprezza hatchback) I have few antenna
options... So I used a dual band mag mount for 2m/70cm.
Then through a diplexor I tok the HF port and sent the 6m to a 1/4wave magmount and the HF to a cheesy 11m magmount (60" whip).

10 and 12 tune easily...but not much open....15m showed some signs and 17m was busy...

Okay this was not an optimal set up by any means...just toss it in the car and see what happens... Didn't do great on the pileups as expected but made contacts in Hawaii, Wisconsin, Indianapolis, Florida and a few others on the drive back.

Today after work I worked a guy in Italy with the same setup...so the bug has bit me for a better antenna system.

So now I know I need a better antenna... so thoughts on going
Hamsticks, hustler (single, 3, or 4 resonator set up), or just using a
102" fiberglass whip.

If I had the funds I'd look at a scorpion type screwdriver antenna but that would be more of a challenge with the small car..

So I am going simple to get a better taste...

Recommendations ??

Order of Cost
1. Ham Sticks, cheap per band but add up when you do multiple bands and
you need to stop to change bands doesn't require a very heavy duty mount
while the rest do.

2. multibander like Comet UHV6. Includes VU6 with 1 or more HF bands.
Good for space limited but really a dummy load on a stick for HF.

3. Hustler with 3 coils. Little more pricy but works good to qsy around
your 3 bands. 75M is very narrow and 40M is only a little better.
Tuner helps but you still only get about 50kHz on 75m

4. small screw driver, Little tar heel seems to be very popular. Quick
QSY not real obtrusive not real cheap either.

5. Full Size Screw driver. hard to mount and not cheap but best signal.

I use options 1 and 3 on different vehicles but am two cheap to go with
the last 2 and am considering getting a little tar heel.

From: Ford Peterson
Topic: 4898 Message: 4898

What would be a good antenna to bring to a state campground? We're planning a trip to Wisconsin and are staying in the new camper. I want to bring my new FT450D with the autotuner built-in. I'm also bringing a laptop and Rigblaster to do some PSK type operations. What would be a good antenna?

Some of the guys talk about a picnic table setup with a balun connected to two wires going up in a V pattern and out as far as you can get it. Seems like a weird antenna but I just want it to take power and let me QSY around with the Autotuner doing its magic.

So what would be a good antenna? I'm not looking for stellar performance. But simplicity and compactness would be nice.

As with most internal tuners, they have a very limited tuning range. It is 3:1 for the FT-450D internal unit. Here are the specs:

The Yaesu ATU-450 antenna tuner is designed exclusively for the <http://www.universal-radio.com/catalog/hamhf/0450.html> Yaesu FT-450. This automatic tuner mounts inside the bottom <http://www.universal-radio.com/catalog/hamhf/1759int.jpg> of the transceiver. The impedance matching range is 16.5 to 150 ohms (up to 3:1 SWR). Accordingly the ATU-450 should not be expected to match long wire antennas. Please note that the ATU-450 cannot be used with the ATAS-120A. A clicking sound during tuning is normal.

Specifications:
* Coverage: 1.8 to 30 MHz and 50 to 54 MHz
* Power rating: 100 watts PEP
* Matched SWR: 1.5:1 or less
* Tuning time: 5 seconds or less
* Input impedance: 50 Ohms
* Tuning power: 4 to 60 watts
* Power Supply: 13.8 VDC (derived from the transceiver)
* Size: 3.1 x 1.5 x 6.1 inches
* Weight: 1.1 Lbs (500 g)

Most antennas like the one you describe will be far outside the tuning range on some bands. Internal tuners are generally good when you have an antenna that is resonate somewhere within a band and you are operating over a wide range of frequencies WITHIN that band. However, an antenna that will resonate in the 75/80 meter band will not be within the range of the tuner on almost any other band as the impedance will be greater that 150 ohms. Having a 4:1 current balun may help for some bands.

It is for this reason that I use external tuners like the Z-11Pro or Z-817 for my portable operation. They can match upwards of 10:1 and in some cases even higher. I suggest you bring along a manual tuner too.

Ford-
I use a Crappie pole unun and a little wire with my Icom 703 when I camp in the State parks (which one are you coming to?)
I've also used hamsticks, a Superantennas MP-1 and all manner of inverted v dipoles. The unun and wire is by far the easiest and fastest to get set up.

Thanks for the feedback...

I do have an HV7A that I used to use with my FT8900...was never really
"happy" wth it although
it did work reasonable well on 2m/70cm and not bad on 10m especially when
the band was open. 6m
FM never really seemed to get out.

I figure I'll stick to the 10m-20m range for now...lately 17m seems to be
the band of choice for easy DX.

Being I don't have much storage place in the imprezza so hauling a gaggle of
hamsticks could be an issue unless
I choose one and stick with it....so to speak.

I figure I'll get a 17m hamstick to start with and work on a hustler
system....

We're heading to Pattison St. Park just south of Superior WI.

After looking at the various feedback from people on this list and others, I think I'm trying to over-design this. So I'm throwing a bunch of stuff in a Tupperware crate and may well try it all. Hamsticks, end-fed, dipoles, it's hard to know what to expect because I've never been to this park before. Will there be suitable trees near the campsite? Is it going to be raining? 90% of the battle is being prepared for whatever conditions are available. I guess that's all part of the adventure isn't it?

Thanks for all the comments. I'll report back what I find. The AT100Pro sure takes the worries out of finding something that will work!

The MFJ hamsticks are nice when you have limited storage space. The have a 3/8-24 connection in the middle to join the whip ferral with the body so you can break them in half without detuning them.

From: cougercat
Topic: 4908 Message: 4908

Hello All,

Can anybody tell me if a LDG - AT-897 Plus Auto-tuner that was made to work with the FT-897 will work with a FT-857D without modifications? If there are modifications to be made, what are they?

Thank you,

--jeff

From: Don
Topic: 4898 Message: 4909

I operate portable frequently when I go camping. My typical setup is a Yaseau FT817ND (QRP) radio using battery power and solar. I take 4 antennas with me. I use SSB 99% of the time

Easiest - Par EndFed 10/20/40 QRP antenna. Last weekend I worked SSB and made contacts from south Florida to Alabama on 40 meters, California on 10 meters and on 20 I worked Finland, Spain, Italy and Moscow. All on 5 watts and about 5000 mile contacts.

Easy - Home made 88 foot doublet. I made this out of two legs of multi stran flex copper wire each 44 feet long. I use 300 ohm TV/ladder line with a 4:1 balun. With a tuner I can work 10-40 meters. I love this antenna if you have a way to get it in the air.

Easy - SuperAntenna MP-1. This antenna works well but is not as good as a the dipole or endfed. It works great on a picnic table.

Big Gun - SuperAntenna YP-3 portable Yagi. If you have room and time this baby is great.

So that's my arsenal for portable camping. These days I take them all in the motor home because I never know what I'll be able to use until I get there.

Don - KB0LPM
Cape Coral, FL

4913. LDG AT-1000

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-08-31 22:58:49 UTC
From: VE3YF
Topic: 4913 Message: 4913

Hi:

Looks like my old reliable AT-1000 has started to give up. For some reason the other night it would tune a 30m Freq (using a 40m Dipole) but then after a short QSO at 200w, smoke started coming out of the unit and also burnt out the Meter Lamp. Now it has quite a bit of trouble tuning WARC Freqs (I have no WARC Antenna's).

I have tested the Tuner on the Non-Warc Bands and seems to work quite ok, although all my Non-Warc Antennae are pretty much resonant for there bands.

Also seems like the Tuner doesn't hold memories any more.

All the tests are compared to my other good AT-1000.

Hope that LDG will respond here, as is it really worth sending away, I don't want to break the bank for repairs.

Has anyone else ever experienced similar problems with their AT-1000.

Tnx

73 De Mike

Dwayne,

thank you very much, it's very appreciated!
Since few months we're working very hard at Chameleon Antenna to create and maintain high quality products.

I've been working on the HYBRID antenna base since about 2 or 3 months already. Beside our new military whip (MIL) a special antenna is currently under design and will be offered with the HYBRID antenna mount. The antenna will cover 6M to 160M and rated at 1500W. The HYBRID works FANTASTIC with the LDG tuner.

We test ALL our antenna prototypes with the LDG tuner.

I've few LDG tuners:

2 X IT-100 Autotuner
1 X Z817
1 X AT200 Pro

The next YouTube video shows a quick Chameleon Antenna Zepp setup with a Ft-817 + LDGZ817. I checked in the Western Public Service System on 3.952MHz with 20W of power with a report of 59.

http://www.youtube.com/watch?v=-5MpM0ZPKYM
<http://www.youtube.com/watch?v=-5MpM0ZPKYM>

The next one was on my balcony still with the Chameleon Antenna Zepp and with a NVIS antenna setup but I was using my IC-7000 and the IT-100 Autotuner. The LDG tune everything from 10M to 80M to a flat SWR! In the YouTube video notice how I'm surrounded by buildings.

http://www.youtube.com/watch?v=OtjJlZEYhJI
<http://www.youtube.com/watch?v=OtjJlZEYhJI>

Cheers,

Carl

4918. TS-590S with AT-600pro?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-09-02 15:02:11 UTC
From: Dave Earnest, K7JJ
Topic: 4918 Message: 4918

Anyone using the 590 with the AT-600. I've been using the 600 with my IC-7000 which came with an Icom interface cable. Is there something similar for the 590? There is a 4 pin AT jack on the back for an external tuner (Kenwood AT300?)

I guess the AT600pro can be tuned manually with the new rig.

Stick a couple of these through your roof.

http://www.sirioantenne.it/prodotti_ant.php?category=CB+27+MHz+Accessories&antenna=+%22N-PL%22+and+%22NE-PL%22+mounts&idc=1008171293&idg=1008171169&idp=14

The spec says DC to 100 mhz but I've been using them to UHF for years without issue. When bolted through a firm part of the roof they will support the largest diamond/commet/maldol 7900 style dual band antennas without problems and seem to handle 50 watts with similar ease.

I also use them for 100w HF and they seem to cope with that too. The 3/8th adaptor is a lovely addition and would hold up 60 inch CB type whip (tuned to 10m of course!) no bother mobile and will hold a ham stick too WHILST STATIONARY! I wouldn't try that on the move though. Put the hamstick on a 3/8th Tri-Mag mount with a good quality short (ie 10 inches) coax straight to one of these mounts. Feed it from the LDG tuner and you're good to go.

The only problem is the plugs are a pain to fit and the riskiest part of the set up as the "spark gap" twixt hot and earth is but a couple on mil. Leave a solder spur in there and you risk your finals. Use mil grade cable, do a real neat job and it should serve you well.

It all sounds wrong but I've used them for years and it just works. I guess some CB stuff was actually over specified.

Hope you find what works for you.

Kav

From: obrienaj
Topic: 4922 Message: 4922

I have had an AT-200 Pro for a year or two but have not used it much. Today I installed an inverted V cut for 80M and fed it with 450 Ohm ladderline to a Balun Design 4:1 balun and a short piece of coax to the AT-200 Pro and Kenwood TS-2000. I read the LDG manual and watched the video on Youtube. I have a few newby questions.

Earlier today I had it matched on a couple of 40 and 80M frequencies. After a couple of hours break , I returned to the shack and found that I had to again tune to get new matches . It seemed to take a LONG time (making me nervous) to get a match. 15-20 seconds. Is this normal ? If not, what time frame should be average ? I'm wondering when I should start getting worried. I was using 5 watts to get matches, I assume it does not need more power to do it's magic ? On my rig's internal tuner , most operations (with OTHER antennas) are 3-5 seconds for a match.

As far as I can tell, I AM in "auto" mode.

Andy K3UK

4923. RE: [LDG-auto-tuners] AT-200 Pro basics ?

Yahoo group: LDG-auto-tuners (2010 — 2017)

Topic: 4922 Message: 4923

It's always difficult to know for certain what is going on. What I can say is this. The time it takes to get a match is on the long side. Did you get a good match when it was done? With my AT100PRO I've seen it where it is unable to match and it searches for a long time only to set it as good as it can get and still have a 2:1 or even 3:1 SWR when it gives up trying. After keying up, a key down will once again begin searching as the SWR is too high and it triggers a new hunt for nirvana.

A resonant 80M dipole is a very difficult load on 40M. Why? Because you are end feeding two 1/2wL dipoles on 40M. Technically, at 2x resonant frequency, you are feeding an infinitely high resistance as it approaches infinity ohms. End feeding a half wave wire is virtually impossible with an autotuner. The best way to accomplish this is to off-center feed it (AKA Windom). Some will start with a slightly short 75M dipole and feed it on 40M with no big issues. 2x 4.0 MHz is 8MHz and quite a ways from resonance on 40M. My guess is that 30M would be an easy match w/your antenna as it is an odd multiple of resonance. Even multiples are simply problematic. There is no magic bullet length either. Some play with 100', which is resonant at about 4.7MHz. Your mileage will vary depending on height, distance the ends are above ground, length of the feedline (a transformation device), phase of the moon, day of the week, air temperature, your age, degree of sobriety, etc.

You are also witnessing why an 80M/40M fan dipole works so well. On 40M and 15M it "sees" the 40M element and the 80M is virtually invisible. On 80, 30, it sees the 80M element and the 40M is invisible. 20M is a tough match since 3.5 x 4 and 7 x 2 are both even multiple half wave wires.

Good luck. Experiment. Have fun!

Subject: [LDG-auto-tuners] AT-200 Pro basics ?

I have had an AT-200 Pro for a year or two but have not used it much. Today I installed an inverted V cut for 80M and fed it with 450 Ohm ladderline to a Balun Design 4:1 balun and a short piece of coax to the AT-200 Pro and Kenwood TS-2000. I read the LDG manual and watched the video on Youtube. I have a few newby questions.

Earlier today I had it matched on a couple of 40 and 80M frequencies. After a couple of hours break , I returned to the shack and found that I had to again tune to get new matches . It seemed to take a LONG time (making me nervous) to get a match. 15-20 seconds. Is this normal ? If not, what time frame should be average ? I'm wondering when I should start getting worried. I was using 5 watts to get matches, I assume it does not need more power to do it's magic ? On my rig's internal tuner , most operations (with OTHER antennas) are 3-5 seconds for a match.

As far as I can tell, I AM in "auto" mode.

The tuner seems like it has a mind of its own. Earlier today it matched OK on 80M. Now it has a high SWR on 80M and will not attempt to make a match when I send a carrier. On 40 and 20 it will attempt to make a match and achieves a match. On 30M, same as 80M currently, will not attempt to make a match.

They are about the same. The IT-100 only works with Icom. The Z-100 Plus will work with any radio.

Date: 2011-09-08 21:23:45 UTC
From: Garry Blosser
Topic: 4929 Message: 4929

OK here is the quote from LDG on their web site: Not for use with the FT-857 because of the mounting. Use the YT-100 or similar for the FT-857.
HOWEVER if mounting is NOT a consideration i.e if the FT-857D and AT 897 were going to be used in a "go-kit" to where mounting would not be to the radio would the AT-897 work without problems with the FT-857D?
I can't see why not. Thoughts!
THANKS,
Sarge

I just got a AT-1000 from E-bay last week. It worked great tuning my antennas with no problem for about 3 days. Then it just stopped getting a match. It will clatter and clatter and then the reflected needle will bounce once high saying that SWR > 3. It does this when I hook it up to my 50 ohm dummy load. I did the memory clear by holding the power and tune buttons while applying power and holding until the needles stopped bouncing. Anyone have any ideas? Thanks Charles

From: John Parkins
Topic: 4932 Message: 4932

Hello All,

How do I reset the memories of my 1000Pro?

I have just put up a doublet and I'm having a few 'issues'.

The antenna tunes fine using the 1000 Pro but I am always able to get
a better match manually than leaving it up to the tuner.

I have the SWR threshold set at 1.5:1 but even if a better match is
available the tuner doesn't set off automatically to find it.

Thus I thought I would try and wipe the memories and start again.

This may be obvious but test it by loading a dummy load. There is a bunch of stuff between it and the antenna. Maybe you have an issue with a connectors or feedline.

Chameleon V2L Mounted on a Bicycle Stored on a Balcony - LDG IT-100 Autotuner

The bicycle was located on the balcony at the second floor.

Radio: IC-7000
Tuner: LDG IT-100 Autotuner
HF Power = 100W

This video shows a simple bicycle antenna setup. The V2L is grounded to the bicycle frame and to the aluminum patio door to reduce the RX noise in the transceiver.

Frequency operated:
40M

I have Z11Pro and use it with IC7000. Very light and good tuning. However it smokes after 10 min of CQing on 10 or 15m. Seems the cores have low Q on higher bands.

As I am going to VK and then perhaps more soon, I would like to take a light tuner with me. Z11Pro cannot be counted as reliable for DXpeditions. I have heard from Dewayne that Z11Pro2 can handle more power. Any experiences?

My initial thought is no. The power rating for the Z-11Pro is 125 watts at PEP SSB. If you run CW, it's a slightly less duty cycle, but during a contest, it's a much higher duty cycle and will most likely go over the rated limits.

Even the Z-11ProII is rated the same, so it should also not be used in high duty cycle environments.

I'd move up to the AT-200ProII since it's rated at 250 watts PEP SSB. That should give you plenty of room for high speed CW at contest rates at 100W.

This tuner has two ports that are useful for interfacing with the radio, one is a male DB9 connector and the other is a stereo miniature (1/8) phone plug. Is it possible to use both interfaces are the same time? What I am considering is hooking up two radios to this tuner, one to each interface.

If you have done this, please let me know how well it worked.

I have heard of a person hooking up their AT-7000 to a Ten Tec Jupiter. Has anyone here done this and if so;
What do you hook the Blue and Green (#5 and #6 on the DIN) wires? Would they be connected to the same spot on the board as the JT-11?

Any help on this would be appreciated. It would be nice to be able to utilize my AT-7000 until I can save up for another LDG.

Thanks,
Jim

I am planning to buy an LDG 1KW tuner for my shack from W4RT. Before I take the plunge I would like to get the following details from you.

My set up contains a Yaesu FT920, RM Italy HLA300V amplifier and homebrewed antennas which have good swr indications in relation to the bands they are made for. I already have a Z11PRO which is connected to a Yaesu ft857d which works awesome. I plan to put the 1KW tuner along with the amp which has an output of 400/500 watts. Now this amp has no alc connection, it works on the rf sense principle and the only connection is rf in and rf out. I will be taking an output power of maximum 15 watts from the rig to the amp which will provide 400/500 watts output. My question is can I put the amp in line between the amp and antenna with mere
Rf in and out or do I need any connections between the rig and amp too. If I am right I will be tuning the whole system with 15 watts in the amp off position, then put on the amp and drive the antennas. The amp have in built automatic band selection capabilities if put in RF sense mode.

Thanks and hopes to hear from you all soon, so that I can go ahead with my purchase.

The Tuner has to be the last thing in line before the antenna. It should be Radio- Amp- then Tuner.

Hi Dave

Why not ask the LDG folks the unit manufacturer folks they would know best the difference instead of have others speculate.

Sri Dave - it is not an answer to your question - just ekstra questions!
I have a version 1.0, what would I gain.
And another question, how do I get the newest version (W4RT does not stock it anymore!)

4954. AT-100ProII odd behavior

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-09-19 17:02:21 UTC
From: dsmoore99
Topic: 4954 Message: 4954

Picked up a slightly-used AT-100ProII tuner on eBay. I also have an AT-600Pro and used to have a borrowed AT-100Pro.

My setup is an Elecraft K3/100 to a Daiwa CN-801 Power/SWR meter to the AT-100 to a 4:1 balun feeding a 66' doublet. Tuning up is not a problem 80M through 6M.

Here's the issue: It seems as if the ANT1/ANT2 jacks or the Ant2 light is wired backwards. My antenna is plugged into ANT1. Checked and double checked. When the front panel indicates that Ant2 is selected I am able to tune up and have excellent reception. When the Ant2 light is off, I can't tune up and don't hear anything.
If I move my antenna to the Ant2 port, it acts exactly opposite. Only tunes up when the Ant2 light is off.
Just like on my AT-600 and the previous AT-100 I used, the ANT1 jack is correctly labeled and in the correct location on the back panel. I know which is which.

Thoughts?

4957. IC-7000 and LDG AT-100 Pro II: Screen flickering, bypass and power switch off-on

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-09-26 15:56:58 UTC
From: frixsix
Topic: 4957 Message: 4957

As this issue comprises a combined setup of ICOM IC-7000 and LDG AT-100 Pro II, I have cross-posted to the "ic-7000" group and to the "LDG-auto-tuners" group.

My ICOM IC-7000 and/or antenna tuner LDG AT-100 Pro II, have gotten "hiccups", which I don't understand and therefore have been unable to remedy. Consequently, I have to seek advice and experience where it best can be found. Below, I will try to describe my setup, what has happened, what I have done to try to understand the problems

The rig is mounted in my car, with the transmitting device and the tuner in the trunk in the back, and the detachable front panel is located on the dashboard.

The detachable front panel and the transmitting unit are connected by a standard 5 metres ICOM control cable, under the back seat and between the front seats to the front panel on the dashboard.

The tuner and the rig is connected by a signal and power cable for ICOM supplied with the tuner. As the tuner is located in the trunk, tuning is normally done from the front panel or from the Tune button on the microphone.

The antenna cable is a Mobinet MC-3M mounted on the MFJ-343 antenna foot mounted on 4TMA antenna bracket tightly fastened to the towbar ball. The towbar is of course connected to the body of the car.

The antenna is a Moonraker AMPRO 20 helical wound whip antenna.

The transmitter is grounded to the chassis (by the centre seatbelt holder under the back seat), while the tuner and power supply is grounded to the transmitter.

The power source is a separate 12V silver-calcium battery in the trunk i the back.

This setup has worked well together both on 20 meters and 80 meters (of course with AMPRO 80 as the antenna of 80 m) until last week. I was then operating on 20 metres, with the car parked and the ignition turned off. Suddenly, the IC-7000 front panel screen started to flicker when transmitting. The flickering showed as hazy vertical stripes and dots across the screen, and clearly was synchronized with the speech. Despite the interference on the screen, sufficient power was transmitted that I was able to work thorugh the pile-ups on several stations in the Middle East and Southern Africa, with good reports.

Since the tuner is located in the trunk along with the transmitter, I did not see the readings on the tuner, but the tuning seemed to be working fine. I noticed that the tuning was fast and figured that the tuner's advertised memory function to speed up tuning was coming into effect. Anyway, when whistling into the microphone, the SWR readings on the ICOM front panel was 1,5 or below. I have since had second thoughts that the tuning was fast because it did in fact not tune, but went into some form of bypass or protection.

After half an hour working through a couple of too tempting pile-ups (still with the flickering screen), the radio suddenly began to switch the power off as soon as I spoke into the microphone. I had not made any changes to any settings, except re-tuned to new frequencies. The power switched back on again immediately. After a new tuning, the same thing happened again.

I then tried to transmit with the auto tune switched off (the red TUNE symbol in the upper left corner of the screen was off), to no avail.

Reducing the transmitter power to 18% (low power, randomly chosen there and then) had no effect. The radio continued to turn itself off when I spoke into the microphone, and then immediately turn on again. When I pressed the PTT-button without speaking, nothing happened other than the transmitter changing to transmit mode. The power remained on.

As the power cut immediately on speaking, I was not able to take any SWR readings on the front panel metre while transmitting a signal.

My best guess is that the power was cut by the high SWR protection circuit, which did not come into effect before a voice signal was transmitted. However, if high SWR is the problem, what caused the sudden change in consequences, when everything worked quite well before? And if high SWR is not the problem, what can cause the radio to switch off and on as soon as I speak into the microphone?

I then tried to tune the tuner manually. First, I changed both the C and L so that the C and L readings on the tuner was approx. in the middle of their ranges, just in case they had run far beyond the end of their scales and failed to reset.

Then I pressed the Tune button, but the tuner immediately switched to Bypass and refused to tune.

I then tried to auto-tune by pressing the Auto button on the tuner before tuning, which tuned to an SWR of approx. 1,5-1,7. Not ideal, but certainly not a big problem for a modern transmitter. However, this produced the same flickering result during voice transmit, but at least the power remained on when I used the Tune button on the tuner.

I subsequently changed to the AMPRO 40 antenna and tried my luck on 40 metres. I had not used the AMPRO 40 antenna before, but it made no positive difference, but offered some negative. All the same things happened for manualtning, as well as auto tuning. In addition, after a short while the radio began to turn off-on-off-on-off-... in quick succession, almost like hiccups. Then I pulled out the control cable from the console, disconnected the power, disconnected the antenna cable, dismantled the antenna, and drove home.

On dismantling, the cables, antenna, antenna mount and plugs all looked fine, with no loose or bad contacts, no moisture, or anything mechanical that could create these problems.

I have since put everything together again, and tried the setup on 15 and 20 metres, with no changes. On 15 metres it seems to work well, with SWR at approx. 1,5 and less. On 20 metres the power stays on and the tuner tunes to an SWR around 1,5, but the flickering appears immediately on voice transmit. I have worked some stations, but I am reluctant to take it any further before I know what is going on, and how to remedy the issues. I have not ventured to try 40 metres.

Does anybody have any ideas about what is happening and how it can be fixed?

Anxiously awaiting your response.

73,
Frode/LA6VQ

Hello Frode,

It's most likely RF getting into the radio from the remote cable. Start with snap-on RF chokes on both ends of the remote cable as well as one on the interface cable to the tuner and the DC power cable to the radio.

As this issue comprises a combined setup of ICOM IC-7000 and LDG AT-100 Pro II, I have cross-posted to the "ic-7000" group and to the "LDG-auto-tuners" group.

My ICOM IC-7000 and/or antenna tuner LDG AT-100 Pro II, have gotten "hiccups", which I don't understand and therefore have been unable to remedy. Consequently, I have to seek advice and experience where it best can be found. Below, I will try to describe my setup, what has happened, what I have done to try to understand the problems

The rig is mounted in my car, with the transmitting device and the tuner in the trunk in the back, and the detachable front panel is located on the dashboard.

The detachable front panel and the transmitting unit are connected by a standard 5 metres ICOM control cable, under the back seat and between the front seats to the front panel on the dashboard.

The tuner and the rig is connected by a signal and power cable for ICOM supplied with the tuner. As the tuner is located in the trunk, tuning is normally done from the front panel or from the Tune button on the microphone.

The antenna cable is a Mobinet MC-3M mounted on the MFJ-343 antenna foot mounted on 4TMA antenna bracket tightly fastened to the towbar ball. The towbar is of course connected to the body of the car.

The antenna is a Moonraker AMPRO 20 helical wound whip antenna.

The transmitter is grounded to the chassis (by the centre seatbelt holder under the back seat), while the tuner and power supply is grounded to the transmitter.

The power source is a separate 12V silver-calcium battery in the trunk i the back.

This setup has worked well together both on 20 meters and 80 meters (of course with AMPRO 80 as the antenna of 80 m) until last week. I was then operating on 20 metres, with the car parked and the ignition turned off. Suddenly, the IC-7000 front panel screen started to flicker when transmitting. The flickering showed as hazy vertical stripes and dots across the screen, and clearly was synchronized with the speech. Despite the interference on the screen, sufficient power was transmitted that I was able to work thorugh the pile-ups on several stations in the Middle East and Southern Africa, with good reports.

Since the tuner is located in the trunk along with the transmitter, I did not see the readings on the tuner, but the tuning seemed to be working fine. I noticed that the tuning was fast and figured that the tuner's advertised memory function to speed up tuning was coming into effect. Anyway, when whistling into the microphone, the SWR readings on the ICOM front panel was 1,5 or below. I have since had second thoughts that the tuning was fast because it did in fact not tune, but went into some form of bypass or protection.

After half an hour working through a couple of too tempting pile-ups (still with the flickering screen), the radio suddenly began to switch the power off as soon as I spoke into the microphone. I had not made any changes to any settings, except re-tuned to new frequencies. The power switched back on again immediately. After a new tuning, the same thing happened again.

I then tried to transmit with the auto tune switched off (the red TUNE symbol in the upper left corner of the screen was off), to no avail.

Reducing the transmitter power to 18% (low power, randomly chosen there and then) had no effect. The radio continued to turn itself off when I spoke into the microphone, and then immediately turn on again. When I pressed the PTT-button without speaking, nothing happened other than the transmitter changing to transmit mode. The power remained on.

As the power cut immediately on speaking, I was not able to take any SWR readings on the front panel metre while transmitting a signal.

My best guess is that the power was cut by the high SWR protection circuit, which did not come into effect before a voice signal was transmitted. However, if high SWR is the problem, what caused the sudden change in consequences, when everything worked quite well before? And if high SWR is not the problem, what can cause the radio to switch off and on as soon as I speak into the microphone?

I then tried to tune the tuner manually. First, I changed both the C and L so that the C and L readings on the tuner was approx. in the middle of their ranges, just in case they had run far beyond the end of their scales and failed to reset.

Then I pressed the Tune button, but the tuner immediately switched to Bypass and refused to tune.

I then tried to auto-tune by pressing the Auto button on the tuner before tuning, which tuned to an SWR of approx. 1,5-1,7. Not ideal, but certainly not a big problem for a modern transmitter. However, this produced the same flickering result during voice transmit, but at least the power remained on when I used the Tune button on the tuner.

I subsequently changed to the AMPRO 40 antenna and tried my luck on 40 metres. I had not used the AMPRO 40 antenna before, but it made no positive difference, but offered some negative. All the same things happened for manualtning, as well as auto tuning. In addition, after a short while the radio began to turn off-on-off-on-off-... in quick succession, almost like hiccups. I had the same problem with my ic-706mkiig. I wrapped aluminums foil around the tuner, and that solved the problem.

Subject: [LDG-auto-tuners] IC-7000 and LDG AT-100 Pro II: Screen flickering, bypass and power switch off-on

As this issue comprises a combined setup of ICOM IC-7000 and LDG AT-100 Pro II, I have cross-posted to the "ic-7000" group and to the "LDG-auto-tuners" group.

My ICOM IC-7000 and/or antenna tuner LDG AT-100 Pro II, have gotten "hiccups", which I don't understand and therefore have been unable to remedy. Consequently, I have to seek advice and experience where it best can be found. Below, I will try to describe my setup, what has happened, what I have done to try to understand the problems

The rig is mounted in my car, with the transmitting device and the tuner in the trunk in the back, and the detachable front panel is located on the dashboard.

The detachable front panel and the transmitting unit are connected by a standard 5 metres ICOM control cable, under the back seat and between the front seats to the front panel on the dashboard.

The tuner and the rig is connected by a signal and power cable for ICOM supplied with the tuner. As the tuner is located in the trunk, tuning is normally done from the front panel or from the Tune button on the microphone.

The antenna cable is a Mobinet MC-3M mounted on the MFJ-343 antenna foot mounted on 4TMA antenna bracket tightly fastened to the towbar ball. The towbar is of course connected to the body of the car.

The antenna is a Moonraker AMPRO 20 helical wound whip antenna.

The transmitter is grounded to the chassis (by the centre seatbelt holder under the back seat), while the tuner and power supply is grounded to the transmitter.

The power source is a separate 12V silver-calcium battery in the trunk i the back.

This setup has worked well together both on 20 meters and 80 meters (of course with AMPRO 80 as the antenna of 80 m) until last week. I was then operating on 20 metres, with the car parked and the ignition turned off. Suddenly, the IC-7000 front panel screen started to flicker when transmitting. The flickering showed as hazy vertical stripes and dots across the screen, and clearly was synchronized with the speech. Despite the interference on the screen, sufficient power was transmitted that I was able to work thorugh the pile-ups on several stations in the Middle East and Southern Africa, with good reports.

Since the tuner is located in the trunk along with the transmitter, I did not see the readings on the tuner, but the tuning seemed to be working fine. I noticed that the tuning was fast and figured that the tuner's advertised memory function to speed up tuning was coming into effect. Anyway, when whistling into the microphone, the SWR readings on the ICOM front panel was 1,5 or below. I have since had second thoughts that the tuning was fast because it did in fact not tune, but went into some form of bypass or protection.

After half an hour working through a couple of too tempting pile-ups (still with the flickering screen), the radio suddenly began to switch the power off as soon as I spoke into the microphone. I had not made any changes to any settings, except re-tuned to new frequencies. The power switched back on again immediately. After a new tuning, the same thing happened again.

I then tried to transmit with the auto tune switched off (the red TUNE symbol in the upper left corner of the screen was off), to no avail.

Reducing the transmitter power to 18% (low power, randomly chosen there and then) had no effect. The radio continued to turn itself off when I spoke into the microphone, and then immediately turn on again. When I pressed the PTT-button without speaking, nothing happened other than the transmitter changing to transmit mode. The power remained on.

As the power cut immediately on speaking, I was not able to take any SWR readings on the front panel metre while transmitting a signal.

My best guess is that the power was cut by the high SWR protection circuit, which did not come into effect before a voice signal was transmitted. However, if high SWR is the problem, what caused the sudden change in consequences, when everything worked quite well before? And if high SWR is not the problem, what can cause the radio to switch off and on as soon as I speak into the microphone?

I then tried to tune the tuner manually. First, I changed both the C and L so that the C and L readings on the tuner was approx. in the middle of their ranges, just in case they had run far beyond the end of their scales and failed to reset.

Then I pressed the Tune button, but the tuner immediately switched to Bypass and refused to tune.

I then tried to auto-tune by pressing the Auto button on the tuner before tuning, which tuned to an SWR of approx. 1,5-1,7. Not ideal, but certainly not a big problem for a modern transmitter. However, this produced the same flickering result during voice transmit, but at least the power remained on when I used the Tune button on the tuner.

I subsequently changed to the AMPRO 40 antenna and tried my luck on 40 metres. I had not used the AMPRO 40 antenna before, but it made no positive difference, but offered some negative. All the same things happened for manualtning, as well as auto tuning. In addition, after a short while the radio began to turn off-on-off-on-off-... in quick succession, almost like hiccups. Then I pulled out the control cable from the console, disconnected the power, disconnected the antenna cable, dismantled the antenna, and drove home.

On dismantling, the cables, antenna, antenna mount and plugs all looked fine, with no loose or bad contacts, no moisture, or anything mechanical that could create these problems.

I have since put everything together again, and tried the setup on 15 and 20 metres, with no changes. On 15 metres it seems to work well, with SWR at approx. 1,5 and less. On 20 metres the power stays on and the tuner tunes to an SWR around 1,5, but the flickering appears immediately on voice transmit. I have worked some stations, but I am reluctant to take it any further before I know what is going on, and how to remedy the issues. I have not ventured to try 40 metres.

Does anybody have any ideas about what is happening and how it can be fixed?

Anxiously awaiting your response.

73,
Frode/LA6VQ

While you are looking, make sure all your 12V connections to the radio are clean. Low voltage will cause all kinds of strange things to happen.

Hello

Someone else suggests you check all 12v connections. To be more specific, check the plug on the back of the radio. The pins in the 706 plug were "folded female" with an unwelded seam and could splay appart over time. I suspect the 7000s are similar. They would seem OK at switch on but under load, due either to heat expansion or smaller contact patch, they could not carry enough current to supply the transmitter. Consequently on SSB, where there is almost the same draw as on RX even when keyed, the TX would not shut down until you actually speak and the load shoots up. Immediately the current draw drops, the radio turns back on.

The fix is an easy one and just involves pinching or levering the walls of the pins together slightly along the split. Just don't over do it.

Also check all other 12v connections, including the tuner. If that doesn't fix it you can try the complete set up , including the cables,out of the car. If it exibits the same fault then you know it is caused by something in the setup rather than RF in the vehicle.

Replace the cables, 1 by 1 and hope one shows up faulty.If it does, rplace it and your sorted.

If the fault does not appear when outside the vehicle, start looking at antenna connections/earths and maybe start fitting ferrites as suggested elsewhere.

Hope you find your solution.

4964. AT-897 tuning power

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-09-29 17:44:43 UTC
From: John Hebert
Topic: 4964 Message: 4964

Greetings from Montreal,

I am very happy portable/QRP operator using an FT-817D with an LDG Z-817, among other LDG products, and I now have designs on the AT-897 Plus to couple with my newer and bigger FT-897D transceiver.

Here then is my question for all you current AT-897 operators in the know: The description on LDG's web page claims the tuning procedure uses 'only 25 Watts' of power on AM during the cycle, but what if you are operating at QRP levels of say 10, or even as low as 5W, as is my current practice with my smaller rig? Can I interpret this to mean that the tuner will send a command to the transceiver to increase the power during the tuning cycle? This seems like a lot of power to me when running off batteries, particularly so with the smaller internal ones....By way of comparison, my current Z-817 uses only a 2.5 Watt signal from my smaller rig to accomplish basically the same task.

Thank you for any help folks!

John

Hello All,

I am new to the group and LDG Auto Anetnna Tuners. I have acquired a LDG AT-11MP which physically looks in good condition, however for a peace of mind, I would like to make sure it will be working correctly.

Are there a set of checks and tests I can do to ensure that everything is fine inside? It already has the version 1.6 upgrade.

I have read in the messages that often the diodes used in the SWR bridge can sometimes fail but besides that, I would like to know if there are a set of standard checks I can make, and any alignment checks.

Dwayne,

Thanks for your response. I am sorry for not having responded earlier, but it has been quite busy on several fronts lately. I finally got around to follow your advice re RF chokes, and clearly you hit. The flickering screen is gone, and the same applies to the power off-on-off-....

I still don't understand why this happens on 20 and 40, but not on 15 and 80, but I am crossing my fingers that everything is solved.

And the K0BG webpage is really something.

Thanks a lot for your help.

Carl,
Thanks for your advice.

It seems like RF was the problem, at least a number of RF chokes removed the problem. The little ground connection screw seemes to be in place and in good contact, but I'll look after it every now and then to make sure it stays in place, too.

Thanks for the input, Jan.

RF chokes solved the problem, but I'll bear the aluminium foil in mind, should anything like this happen again.

Cliff, thanks for your advice.

The 12V conenctions seemed all to be ok. The rig and tuner are brand new and I would be sorry if bad contact was the problem on new equipment, but I guess it cannot be ruled out. I am a fresh ham (6 months) and have a lot to learn, and I guess not all ham equipment is super quality.

RF chokes (ferrites) solved the problem for now, but I'l bear contact problems in mind, should the issue pop up again.

From: frixsix
Topic: 4957 Message: 4970

Thanks Kav, for your advice.

It seems like RF was the issue, and a few RF chokes in vital places solved the screen flickering and the on/off issue for now. It seems like the sensitivity to voltage drop and the power contact problem are known "features" with the IC-7000, and your and others' advice will keep me alert to this issue if/(when) other problems arise.

73,
Frode/LA6VQ

>
>
> Hello
>
> Someone else suggests you check all 12v connections. To be more specific, check the plug on the back of the radio. The pins in the 706 plug were "folded female" with an unwelded seam and could splay appart over time. I suspect the 7000s are similar. They would seem OK at switch on but under load, due either to heat expansion or smaller contact patch, they could not carry enough current to supply the transmitter. Consequently on SSB, where there is almost the same draw as on RX even when keyed, the TX would not shut down until you actually speak and the load shoots up. Immediately the current draw drops, the radio turns back on.
>
> The fix is an easy one and just involves pinching or levering the walls of the pins together slightly along the split. Just don't over do it.
>
>
> Also check all other 12v connections, including the tuner. If that doesn't fix it you can try the complete set up , including the cables,out of the car. If it exibits the same fault then you know it is caused by something in the setup rather than RF in the vehicle.

4971. LDG DWM-4 Wattmeter Query

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-10-03 16:03:59 UTC
From: Dick
Topic: 4971 Message: 4971

Is it permissible to post questions on other LDG products, such as the DWM-4 Wattmeter ?

I have one and it looks like the uProcessor has gone bonkers. I tried to re-program it (and also a new chip) but no luck.

Anyone have a Display Box they no longer need ??

Thanks, Dick, W1KSZ

Hello Dick,

Yes, it's permissible to post all things LDG here. The LDG line of S9 antennas has it's own group (http://groups.yahoo.com/group/S9Antennas/), but this is the largest LDG group and everyone is happy to provide answers when they can.

I got one of these and plugged it into the key jack:

"Push-to-Tune Cable
Carrier Output from FT-857(D)/897(D)
at the Push of a Button"

Plugged it into the Key jack on the back of the 817, set mode to CW and tuned the Z-11Pro II at the antenna.

Apparently this tuner is made for this radio.....

However,where I am puzzled is this...once set, does the radio and tuner work in conjunction with each other by tuning automatically or do I have to hit the button on the tuner every time I go to a new frequency?

thankyou so much

HOLA from Ecuador. I am Dr Don HC4/W4BWS.
I just joined this group. I recently acquired a used
Ft 840 and LDG 100 Pro tuner. An oldie but a goodie.
Was a backup rig on a ocean sailing ship and owner
used it twice and then stored it in a Pelican case
for 8 years. So it is like new. Operation with the
tuner on auto is great, except my wife hates the noise
of the relays. I just need a cw filter and FT 747 FM
board to complete the setup.
I may want the 600 watt tuner when I get the SB200 on line.

Hope to work many from Ecuador.
Dr Don W4BWS

I find I have to hit the TUNE button on the YT-100 each time I change bands. But, once a band has been tuned, you only have to hit the TUNE button for a second so you don't have to go through the whole tune cycle each time.

AFAIK, according to the LDG documents, the cable allows the radio tune button to initiate the tune cycle and the tuner to tell the radio to transmit a low power signal. The tuner then tells the radio to stop when a match has been found.
This allows manual tune instead of automatic sensing of the RF at high power and having the radio swr protection circuit reduce power to protect the radio.

4981. Web update and FREE Balun/unun offfer.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-10-15 23:17:46 UTC
From: Dwayne
Topic: 4981 Message: 4981

Hi All,

We made some minor updates to the web site this week. The tuner interface app note was added to the support page. This give more information on how the interface works for the generic LDG tuners (Z-100Plus, Z-11ProII, AT-100ProII, ect).

We also announced the FREE balun/unun offer valid from today through April 15 of 2012. That's a free LDG RBA-1:1, RBA-4:1 or RU-4:1 with any tuner purchase.

Standard disclaimer: one per household, valid worldwide, your mileage may vary.

4982. LDG Z-817 tuner problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-10-18 21:49:40 UTC
From: Terry
Topic: 4982 Message: 4982

I purchased the LDG Z-817 tuner originally for my FT-817 radio but never used it. Recently I purchased a FlexRadio 1500 SDR which puts out 5 Watts maximum. I hooked it up and everything seemed to work well. However, now none of the LED's come on when I press the tune button. Yes, they are new batteries and I checked them again to make sure. I have used the tuner for less than one hour and have not transmitted with it as I am still learning to use the FlexRadio. The tuner does appear to be working, but none of the LED's light up. I am using a center fed offset dipole fed by 450 ohm ladder line with a 4:1 balun and 50 Ohm coax to the antenna tuner. I use this antenna with my FT-897 radio and LDG tuner with no problem. Any suggestions?

The tuner requires the Tx to be sending a carrier for it to start tuning.
Some radios have a cable that connects from the tuner to the radio
that will start a qrp transmission when you push the tune button.
Make sure your flex radio will accept this command AND TURN ON AND
TRANSMIT.
My LDG PRO requires this and I'm sure the Z-817 does also.

Don,
Thank you for suggesting this as it makes sense when you think about it. I will try it and provide feedback as to whether it works so that others can benefit.

Hi Don,
I just tried holding in the PTT to transmit and then pushing the tune button on the LDG tuner but none of the LED's came on. When I originally started using this tuner the LED's were coming on but now nothing. Without a schematic I do not want to go poking around in the tuner unless I know what I am doing (even though I am a retired EE). Any other suggestions?

Pressing PTT will not produce a carrier unless in AM or FM also make sure the interface cable is connected. Iused to tune my Z100 in cw. Using the interface with my IC7200. I can just push tune.

Problem AT-200 will not tune incoming signal on 10.139.40. I have done the manual full tune as listed in the book but it seems to get lost after tuning any other frequency not in the 30m band. Has anyone run into this problem? Any help would be appreciated.

Topic: 4988 Message: 4988

Just picked up an AT11mp and hooked it up to my ic718. Made up a 3 wire cable from tuner to rig. I set the ic718 for AH4 type tuner.

Problem
tuner never tries to tune...it just sits there.
meter needles never move showing output or swr.
rig is putting out just fine when I use another swr/par meter.

Seems like microprocessor must not be working!

Any suggestions appreciated.

Ken

Have you tried using the tuner manually? What does the meter on the 718 show? These tuners require a carrier for them to work. If it works manually, double check your interface cable

Hope this helps

4990. Re: Camping antenna

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-10-20 17:20:38 UTC
From: John Hebert
Topic: 4898 Message: 4990

Good morning,

You would be wise to consider the Buddipole antenna system in all its various shapes and configurations. This antenna works on most bands above 40m by adjusting coil taps and extending/shortening whip sections, thereby negating the requirement to cary seperate tuner. I understand your FT-450D's built-in tuner has limited tuning range, which is to be expected, so Buddipole is worthy of your consideration if you have the patience and inclination to learn to use correctly. Having enjoyed mine (deluxe version with mast, tripod, etc) during this year's camping season, I have nothing but praise for it. For sure, has certain limitations given its compact and portable design, so one should NOT compare it to full size designs, obviously. But if you want a 'system' that is quick to set up and guy (a must, unless you get the Buddistick with clamp for table mounting) this puppy is for.

This product has often been described as an antenna 'laboratory', immensely reconfigurable either as a dipole, vertical, L, inverted L, yagi (see options on www.buddipole.com), so it will provide you with plenty of learning opportunities as well as many QSO's. Factory support is excellent, and they have a very active and friendly user group here on Yahoo, with lots of talent, experience and creativity. Go and see for yourself before commiting, and I am confident you will agree.

Have a great day, and I hope this helps.

Hi Ken,

You would need a 4 wire interface cable for that radio and tuner. Here is a link to the interface diagram on the our web site:
http://www.ldgelectronics.com/c/252/products/13/23/2

You would also need to set the tuner menu in the radio to 4 for "AH-4" mode.

4993. AT-200Pro Autotuner LED testing

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-10-21 04:39:57 UTC
From: johnmarthens
Topic: 4993 Message: 4993

Recently I reactivated an idle AT-200Pro unit and find that when energizing the unit the first LED on the bottom row remains blank/black. All of the other LEDs turn on (red) and the unit seems to work. I felt that maybe one of the legs of the LED may have experienced a poor solder joint, but upon close physical inspection there does not seem to be such a problem. I also (without any power to the unit) put a multimeter test upon the 'defective' LED and all of the other LEDs (all light up nicely) that all of the LEDs show the same or nearly same resistance values (approx. 0.690 ohms).

So, the question is, how do I find out if the LED has failed?

Your comments would be appreciated. Oh, and yes, the tuner seems to be working properly in tuning of antennae.

Best if you find a ant analyzer. The lower bands tend to be fairly narrow band without a tuner and you need the analyzer to see where they are resonant at.Then you can shorten the legs to get them resonant where you want them. AD tends to tune them to the lower end of the band so that you can shorten them

I took down a Cobra Sr and a G5RV.

I am now using a QSO King 88-ft end fed wire. The secreit in the QSO King (found on eBay) is the 9:1 balun. I am able to tune 160-6 meters with the AT-600! Really touchy on 160, but on 80 up ; no sweat.

I am using Inverted-L configuration; vertical about 30 feet and the end slopes down to about 12 feet.

Also look at the Balun Designs web site. He sells the baluns.

I have the AT-600pro.

I put the tuner in bypass mode where the light is lit but it does not stay in bypass mode. It wants to try to tune instead. Is there a different bypass mode or is there something screwy with the software in this box?

I only need the tuner on a couple of bands/antennas. Is it better to turn the tuner off?

I am sure I am missing something simple.

Mike W0MU

Take the tuner out of auto mode. Then it will only tune when you hit the tune button.

Subject: [LDG-auto-tuners] Bypass mode issues

I have the AT-600pro.

I put the tuner in bypass mode where the light is lit but it does not stay in bypass mode. It wants to try to tune instead. Is there a different bypass mode or is there something screwy with the software in this box?

I only need the tuner on a couple of bands/antennas. Is it better to turn the tuner off?

I am sure I am missing something simple.

Hi,

I recently got a tidy LDG AT-11MP autotuner. I know it is not in production any more, but I am a bit strapped for cash so couldn't buy a new shiny LDG.

The AT-11MP seems to be in good condition and does tune OK most of the time, however I noticed that it has RFI problems with the HF bands from 15, 12 and 10m, with 10m being the worst. I have worked at putting chokes on the power cable and also in the feed into the shack, and it seems to be a bit better, but I just can't seem to clear 10m, RFI keeps causing the autotuner CPU to go nuts. I can actually hear the transmission on the little speaker inside the AT-11MP!

I have double checked my ground, but maybe I am missing something, so might just redo everything, however, it seems that the AT-11MP seems to be hypersensitive to RFI. Is this the case? and are there any fixes I can do that others have found that help?

I have also noticed that in "standby", when the tuner is in "bypass", there is a VSWR reading of about 2:1+ on the rig SWR meter. Could I have a faulty relay somewhere?

Is there a guide that I can use to test all the parts of the tuner to ensure that it is OK?

Kind Regards,

Andre', M0JEK

I have a z11pro that I used with an Icom 7200. The tuner matchs the antenna but the Icom reports a high swr while the tuner reports a good match. And of course the Icom rolls back the power. I can get good matchs with my manual tuner. I am using a 80 meter OCFD with a 1to1 balun at the feed point the antenna is a bit low and strung up in the trees about 130ft from the station. I do work a fair amount of psk and other digital modes.
What questions should I be asking to improve station performance with the z11pro

Hi Andre,

Try adjusting the length of your feed line. My tuner had a big
problem with 10 meters also until I added a length of coax that
was 6 turns in about a 1 foot diameter. Then it worked great.

Good luck & 73

Topic: 4999 Message: 5004

Dennis,

I would seriously doubt the YT-100 will give 40 through 6M on an 8 foot whip. The most common results that we have seen is 10 through 20M. However, occasionally, with a really good grounded (bonded) vehicle, we've seen people get 40M.

Look at http://www.k0bg.com/ for tons of info on mobile installations.

Depending on your radio, you may be better off with one of the "brand tuners" for and end fed wires or an SGC tuner. Those are specifically made to tune a short, end fed wire. Of course they cost more, but if that is the specific requirements you need, that may be the answer.

What a lot of people do for a compromise (meaning staying within a budget), is use the LDG tuner, then two hams sticks, a 40 stick will usually tune from 80 to 20 and a 15 stick will tuner from from 20 to 10. A lot less changing, but about half the cost.

Hello all,

We currently allow the user to put the tuner in bypass, but if the tuner is also in Auto mode, it may retune if the SWR goes above the Threshold level. So to truly put it in bypass, it requires the user to change to Semi mode, then put the tuner in bypass. At that time, the tuner will not retune and will remain in bypass.

The proposed change is that when the user places the tuner in bypass, it also changes the Auto mode to Semi, therefore locking it in the bypass.

There are two schools of thought on this. If the user wants bypass, they press the tune button briefly for bypass. Then can press it again to return to the previous tune. This gives a good way to check the tuner in and out circuit very quickly.

The second thought is they want to bypass and leave it there and transmit no matter what the SWR is. The new change would allow that.

We're seeing about 50/50 on each method by tech support calls. We picked the first method just because we had to pick one or the other. Now it's looking like the second method bypass changes to Semi mode is being more and more requested. It seems a little easier to understand as well. The first method requires you to remember that Auto mode take priority over Bypass. Now most users want Bypass to mean Bypass and that's it.

Chime in on those that have AT-200s, AT-600s and AT-1000s to which that you would rather see. I'd make it a poll, but it's too complicated to make it simply two choices and we'd rather hear directly from the users.

The main reason we are asking is we have another higher powered tuner coming out next year and we want to put in the Bypass method that is most requested.

Thanks!

Dwayne Kincaid

Just a thought, but couldn't you just make it a user configurable option? That way the end user decided how the bypass mode works.

I like the current mode of operation. I will put the tuner in bypass to change bands and listen around. When I find a place I want to transmit at I'll key and let it auto tune. This works especially well when I'm using memories on the radio to switch bands as I know the tuner will get a match with the first word I transmit.

Hi Rick,

Thank you, I will give that a try. I am using a choke based on a design that uses ferrites, but I am wondering if maybe it is not being affective at 28 Mhz, or there is something else wrong. I must admit, feed line length did cross my mind ...

RFI in the shack can be a pain to fix at times.

Hi Dwayne, not the answer you want I expect but can't you pick a default but support both and let the user select?

Most of the time my AT200 pro lives in a weatherproof box and operates in full auto, and sometimes with heavy snow and ice, less frequently when the trees have leaves and heavy rain, there is a need to retune established antennas, and ietting the tuner temporarily adapt without operator intervention is a nice feature.

But when I'm antenna experimenting there is a real need to stay in bypass sometimes.

Can't I have my cake and eat it too? ?(I'll live either way)

Scott

I use the AT-200Pro, and as far as I'm concerned, the easier the
better. A single button-press is much simpler than having to first
change the mode.

Thanks for the opportunity for input!

Topic: 5005 Message: 5014

All the tuners,not just the higher power one's, should go to true bypass;a user select for either way would be great and make everyone happy,but if only one way or the other, my vote is for true actual bypass
I always hated that when I put the tuner in bypass,it would re-tune when I didn't want it too.

Bypass to mean that the tuner is completely out of line. When not in
bypass the tuner should be in auto mode as the user wants to use the tuner.

When in Bypass I do not want the tuner coming on line for any reason.
Most manual tuners have a bypass switch which takes the tuner out of line.

5016. Antenna troubleshooting: Frequent re-tunes/SWR up and down

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-10-30 00:06:41 UTC
From: Andrew O'Brien
Topic: 5016 Message: 5016

Any suggestions..

My inverted V (Ladder line from Inverted V to 4:1 balun and then short coax length in to shack) that has been working well with an LDG AT 200 Pro tuner .
Lately it has up and down SWR readings. On 80M it is constant, finds a match but the tuner attempts a re-tune every few seconds. On 40M a match 'sticks" at low power but starts attempting a re-tune if I go above 70 watts, SWR then is up and down.on 20M pretty much the same, good SWR until I get above 55 watts, then jumps all over place.

Nothing obvious here, no ice of snow.

The same antenna plugged in directly to my rig and internal tuner establishes a match without any issues on 40M. Alas , no match is found on 80M 20 , so can't compare too much for those bands.

I may replace the short piece of coax from balun to shack and see if that helps.

Kind of sounds like your balun is failing. Could also be joint failing or getting corroaded.

Thanks for the suggestion Jimmy, I did notice a increase in RF getting in to speakers in the shack recently. I will sniff around and see if eliminating stray RF helps.

Thanks again to Leonard and Jimmy for their suggestions. I seemed to have solved the problem. I was using it with an Elad switchbox in line, SWR is stable when I simply use the LDG with a direct connection to antenna feed line. Whether it is the switchbox or the cheap coax jumper I am using, I'll have to wait until tomorrow to test.

The manual says that when turned off, the tuner is in sleep mode and bypassed. Looks like that's what you need. The 1000-Pro works similarly, only it bypasses to antenna 2.

One good feature of LDG tuners since the QRP has been use of latching relays. These require a coil pulse to go back to bypass position but consume no power when set. This means that normally they will not return to bypass unless the firmware used resets them on turnoff. Where there are two outputs, such as with the LDG-1000-Pro, it's possible to have both; ANT1 does not return to bypass and ANT-2 does.

Usually, and especially on battery power, one doesn't want to keep using power when tuning is finished.

A parts list and schematic would be nice in the manuals

Perhaps in the files section as well

I'm about to buy a second Z 100 Plus

That's if I can make it do the same as the LDG tuner for the 817

That's push the tune button and every thing is done automatically

Even if I've got to build the interface myself :-(((

Regards

Is the resistor near the "transmitter" connection and the round magnetic core?

I'm sure a quick call to LDG might help.

What happened to burn it out? A lightning hit, too much power or no antenna connected?

Based on my Z-100, it might be 75 Ohms.

Craig

we'll copy their design !!

As for me, I put them on the S(pecial) List and refrain from doing business
with them in the future. Their products are not unique in the marketplace.

Dick,

It's very easy to copy our design. Several companies have already done that.

When we sold the units as kits, we provided schematics. Once we changed to assembled units, we stopped including schematics.

Yes, there are many other autotuners on the market. If receiving the schematics with your unit is a requirement for you, then obviously you are free to look elsewhere.

It has nothing to do with our attitude, it's simply our policy. If someone needs specific help with a repair, we are more than happy to assist them.

Everyone here is free to post their opinion (as you have), just keep it civil.

Answer from LDG makes sense. They dont have a service manual. They are small and the thing is microprocessor controlled so there isn't a lot of user serviced items. They said they would provide any information needed.

Dwayne,

Could you let us know who has copied the LDG design? AFAIK, there are only two other companies that make similar products, MFJ and SGC.

If your design has already been copied by several companies, then you might as well release the schematics. Or maybe I am missing something here?

I can see both sides of the coin on this. In all honesty the components inside any tune are pretty basic, and if a company wants to copy a tuner all they would have to do is buy one and open it up and with a few select pieces of test equipment they can be reverse engineered. An auto tuner like LDG is noting more than an selection of Cs and Ls that are either placed in the circuit or removed via relays. LDGs real proprietary information is contained in the microcontroller code that controls the tuning(and the actual algorythm)as well as the storing and retreival of the tuning information.

There are plenty of companies that do not publish their schematics, you don't see people complaining that sony does not include their schematics in each of there TVs or stereo systems. It is really up to the LDG, and if they choose to not publish the schematics so be it. I love my 200PRO, it has worked with any antenna I have thrown it. Schematic or not I will always recommend LDG to anyone who asks me.

I agree. Also, LDG support is readily available and helpful.

I have three of their tuners now, and even a pair of (the now collectable <g>) DTS-4 switches and a DTS4-R controller. When I destroyed a relay in one of the switches by my operator error, they were kind enough to send me a free replacement relay. There was no need for a schematic in that case, just simple troubleshooting. I can see where it would be harder to diagnose a tuner problem however.

I have prevailed on one manufacturer for a schematic before, with the sending of a non-disclosure agreement, because I also like to have schematics of what I own. I still have not needed it for a repair. The schematic gives me a better understanding of what is going on inside and helps me as an experimenter get more uses out of a product. (But sometimes that's when the smoke gets out as well!)

Dave KI4PSR, another LDG fan!

I have 3 LDG tuners. Two Z11 and one Z11-Pro.
One of the Z11 is a really old one and when the relay driver chip died
I found out that it was obsolete and not available anymore. After a call to LDG they took one out of their still existing tuner and send me the chip for free. No need for the schematic to find out that the signal to the chip was ok but the relay were not switching.

A great service and great tuners, you can't ask for more.

5046. Do I need to be concerned? SWR readings on bypass of LDG AT-11MP

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-11-08 14:35:59 UTC
From: kawayuppie
Topic: 5046 Message: 5046

I have a LDG AT-11MP and I noticed that when the tuner is in bypass and connected to a 50 ohm HF dummy load, the rig SWR meter can read a higher VSWR ratio on some HF bands. Here are my findings. My dummy load is only a 25 watt, hence that is the highest power I used.

I selected the middle of each amateur band and then transmitted a carrier in each case and noted the readings. I did check without the tuner in circuit to ensure dummy load and cables are correct, and I had a 1:1 SWR reading on all bands.

Here are my findings with tuner in circuit and in standby which according to the manual is same as "bypass":

Using 10 watt power:
a) 1.8 - 18 Mhz SWR 1:1
b) 21 Mhz SWR 1.3:1
c) 24 Mhz SWR 1.6:1
d) 28 Mhz SWR 2:1

Using 25 watt power:
a) 1.8 - 14 Mhz SWR 1:1
b) 18 Mha SWR 1.2:1
c) 21 Mhz SWR 1.4:1
d) 24 Mhz SWR 1.7:1
e) 28 Mhz SWR 2.2:1

As you can see the lower HF and MF bands are pretty OK, but the upper HF give me some concern. Should I be concerned? Is there maybe a bad connection somewhere?

I am going to say a bad connection somewhere. Either that or the relay contact is going bad, and you are only seeing it at higher frequencies.

Good point. I will see if I can see anything. I did get schematics with this tuner, so I suppose I should be able to trace this out.

I wonder if I will be able to buy spares for this old tuner if I need too?

You do not necessarily have a problem. Several of your coax lengths can affect the SWR on the higher frequencies. Anything under 2.5:1 is OK with worst case about 80 Percent power transfer. As long as the transmitter will load and put out power to the antenna. But it is good to check that coax lengths are not near 1/4 wave from source or load to measurment points. Also, it is well known that the LDG tuners in bypass mode add capacitance across the line, they are not invisible. So there have been a couple articles where users added bypass relays inside the case to go dorect from input to output in bypass mode.

Hi Andre, have you tested your dummy load/tried a different one? That could also be an issue if it is no longer 50 ohms or there is a connection issue in that.

Good luck with getting it sorted.

A TenTec Omni D i'm thinking of buying does not have AM. How can I use an ATU with this if the radio has no setting to put out a signal the ATU can tune on? Or am I missing the idea of how an ATU works. Please forgive a new to HF ham. I need some advice. Thanks!

PS I have not bought an ATU yet so suggestions or offers of sale for units that will suit the purpose are great!

Thanks!

CW works just fine for tuning.

Switch to CW mode, reduce the power first... then hold down the your CW key until the tuning process is finished. The auto tuner will tune up fine.

The Ten Tec Omni D was a great rig.. I owned one 25 years ago and had lots of fun with it. It has very rugged finals but in case you do not know.. the Ten Tec Omni D does not have any SWR protection. It depends on the power supply overload tripping on high current. If you are not using the Ten Tec power supply.. be sure to get a DC circuit breaker. This will save you a lot of fuses.

My choice of LDG tuner is the Z11 Pro. (I have 2 of them) It will work with any radio, doe not require a radio interface cable. It will even work with a QRP rig so does not need much power for tuning up.

Don't think you would want to use the Z11Pro with the omni D. I think
the omni D is a 200W rig so you should be using the AT200Pro or ProII.

The OMNI D is only 100 watts out. I had one for some years. Nice radio. To tune It is very easy to reduce power on CW by using a front panel control.

Ok. Riggs Pix <http://www.rigpix.com/tentec/omnid.htm> had it listed as
200W but reading the TenTec brochure
<http://www.rigpix.com/tentec/tentec_omni_a_d_1979.htm>, that is input
to the final so RF output would be closer to 100W. Regardless a lot of
the older 100W tube rigs put out more than 100W and are not recommended
to be used with the Z11Pro series per LDG. The AT100 or AT200 series
should be used with those radios.

This is very good info Ken. Thanks! I will get one as soon as I can.
I wonder if there are any mods or add on circuits to give this radio a
way to shut down or fold back power on high SWR? I'm going to put up as
much wire as I can in a horizontal loop and feed it with 450 ohm ladder
line as a first try.

So there is no way that I can leave the radio in SSB and tune on the fly?

Hi Ronny,

Auto tuners will tune in SSB mode.. You still want to keep the power down.. You just have to whistle.. talk anything to get some power going out of the radio. So if you changed bands, or moved frequency in a band enough, as soon as you started taking, the tuner will start tuning if necessary.

For SWR protection, no mod is needed.. this is the way Ten Tec has done it with there rigs for years and it worked well. For base operation it is nice to use the Ten Tec Power Supply design for the radio. It has the built in over current protection. For mobile or any other operation without the TT PS get a fast action DC circuit breaker of the correct rating (18a). TT should still sell them.

The finals, (transistor for the person who mention tubes) are very rugged. As long as you do not exceed the max current, for a period of time, you will not damage the finals. This radio is not that picky what SWR it sees, it is the current you have to watch. If you have to, you can operate at lower power with a bad SWR and still get on the air. You don't hear much talk about blowing Ten Tec finals.

One example.. a Ten Tec Omni was used at school for the kids ham club. One day in the rush to leave the class something was accidentally knocked on to the CW key and not noticed. The rig was set for break in so it keyed.. It was over an hour before the teacher discovered the mistake shutting things down for the day. During the whole time the radio had been putting out a 100 watt carrier. No damage was done to the radio, it was not even excessively hot.

The power output is rated at 100 watts but I forgot that this is a very conservative rating, mine did more, especially with with an outboard Rf speech processor.. You may well want to look at tuners that have a 200 watt rating, to be on the safe side..

5059. AT200PRO -- OK to let it tune itself?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-11-11 19:02:00 UTC
From: ka4bls
Topic: 5059 Message: 5059

I have used an LDG AT200PRO with an Icom IC-706MKIIG and a 75 meter dipole for years and I love the combination! Lately I have experimented with Ham Radio Deluxe, hoping possibly to eventually access my rig remotely.

I find that the TUNE button on the Icom is not supported in the Icom CI-V command set. The AT200PRO will fire off tuning activity automatically when it detects high SWR. Will I damage my tuner if I switch from band and frequency to another and just let the tuner do its thing when I key the mike?

I run barefooted on SSB!

73,

Don/KA4BLS

I am sure, like the mobile Yaesu radios the 706 has an SWR rollback circuit so the radio will be fine. The tuner itself is designed to work in this way for rigs without an interface to the radio so I see no problem here. Given the AT-200 Pro is 200w handling too, you certainly won't abuse it enough HI.

Enjoy your experiments with HRD.

Don, that is ok wen the AT200 tune itself. It is also written in the manual that it is ok. The AT200Pro is very rugged. Often I used mine with 500 Watt power without problems.

5064. Potential Z-817 issue

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-11-14 23:18:29 UTC
From: m0saz
Topic: 5064 Message: 5064

Hi all,

I have a number of LDG tuners, AT-200 pro, Z-11 pro and a Z-817 (as well as previously owned an AT-100 pro etc) and having used them, I wouldn't use another brand. Anyway, a while back I sold my FT-817ND and my Z-817 and having missed them bought the FT-817ND a few months ago and the Z-817 tuner recently.

I am having problems whereby the rig isn't always switching to packet mode, I sometimes am having to push full tune a second time before it will kick in. Instead of tuning, the red LED will blink, indicating no RF. I can't see anything wrong with the FT-817ND and I have sent the Z-817 back to the dealers who say it checks out fine.

I have tried using the FT-817ND with PSU in case the batteries weren't driving the rig well enough but to no avail. Memory tuning on the Z-817 seems a bit hit and miss also.

From memory, the previous Z-817 tuner I owned was much more responsive than this. I can post a video explaining what I mean if it helps. I am not saying the tuner is at fault, it could be the radio, but I would like to know if I am missing something. All leads are pushed in well and I have tried different antennas.

Topic: 5064 Message: 5065

OK replying to my own post here, but just to note I just tried setting the radio to 5w and the tuner seems much more responsive - strange, because I was sure the tuner put the radio into PKT mode and reduced the power. I was running it at 2.5w but the tuner seems fussy.

Anyone got any similar experiences?

Thanks,

Mike

Not one bad experience from me. Tunes anything you can think of and is very quiet considering and very fast. I love mine (I use it with the FT-857D).

Some reviews here: http://www.eham.net/reviews/detail/5388

From what I understand, there is very little difference between the Z-11 Pro2 and the older Z-11 Pro.

Mine works great at 100w and will also tune at QRP levels, which some models can't do (they need more drive than QRPp).

If you read up on L-match versus T-match tuner design, you find that the L-match won't give a good match indication at a grossly inefficient setting like a T-match can be adjusted to do. I have melted down a 300w T-match with a 100w radio (in a contest) by unknowingly adjusting it to a good match indicated on the radio, but it was very inefficient. Power was being wasted in the matching circuit and eventually melted the coil.

The L-match circuit won't give that combination (good indication at poor efficiency).

Just to say the dealer narrowed the fault down to the CAT cable, but just in case it was the socket are going to swap the unit out in its entirety. Great service. Great tuners... LDG are quality products I have come to depend on!

Got a YT-100 tuner for my ft-857d....LOVE IT! It integrates directly into the radio using the CAT cable. The only negative thing I have to say is that the jumper a jumper was not included..thought the CAT cable was. I made due till I got one, but bottom line, I am impressed.

So far on a G5 I have tuned 80, 40, 20, 17, 12, 10 and once in a while 60.....

Another follow-up, before sending back they discovered it wasn't tuning on every press first time (especially when the battery was running low), and they considered swapping out the FT-817 but as I had the W4RT one board filter it would have been more messing around, taking it out and me sending over my MuRata filter etc.

Soooooooo.... they tried an Z-817H and it never missed a beat, they even said although the tuning time was slightly longer, persumably because of the larger relays, it seemed to tune 1:1 on an antenna which was marginal on the standard Z-817 (even though they are spec'd the same resistance range). So I have paid the difference and have the 70w version of the ATU coming which is probably more versatile anyway with the extra power handling etc.

Hi Mark, I also have the Pro 2, an excellent little tuner.
Have you installed your S9 with all required radials, recommended 4:1 UN/UN and 50feet odd of co-ax? On 20M the your S9 looks much like an end-fed half wave with the resultant high impedance appearing at the feedpoint. The Pro-2 is unable to match that without help! There are other better ways but the LDG recommended installation set-up goes some way to deal with the high impedance by bringing the feedpoint on this (and other bands) to a point where the Pro-2 has a fighting chance to find a match. If you're familiar with EZNEC and TLW, plug the numbers in and you'll see how hard the Pro 2 has to work!,

If you've installed the antenna according to LDG instructions, you have a different problem. Check all connectors/connections and for dodgy co-ax.

Hope you get it sorted soon.
See you on 20M!
73,
Wes.
GW3RIH.

5078. Help with SWR bridge adjustment on AT-11MP

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-11-20 22:08:17 UTC
From: Philip
Topic: 5078 Message: 5078

Hi all.

I have a AT-11MP. Need to readjust the SWR bridge.
The manual states with 100 Watts adjust the preset for 4.5 Volts on the FWD test point, this has power meter why off the end. If I adjust the preset so the meter shows 100 watts the FWD test point reads 1.6 volts.
This ATU has firmware V1.6 fitted. Are the voltages correct.

Philip g7jur.

5079. Just 1 tuner ?

I have an Ft-817 and an Ft-857.
I have a LDG tuner for the 817 and use an atas 120 for the 857.
I want a tuner that I can use for either radio including if I use a brick on the 817.
Planning on using the radio{s} with hustler style mobile antennas.
I know I could contact LDG but thought I'd rather run it past the
group first.
The tuner for the 817 is the one for low power.
Any ideas on just one tuner for both ?

Rich KC8HMJ

If I had just one, I think I would go for the Z-11 Pro II. It will handle 100w, run on batteries if needed for portable work and the tuning range is among the maximum for the LDG range 6-100 ohms. The lead that comes with it will run on the FT-857 to automatically key the radio when you use the tune button and I am pretty sure there is a cable you can get for the FT-817 (but even if there isn't, the tuner is fully automatic anyway)....

I just got a Z11 Pro II two weeks or so ago. I needed a replacement to fill in while my AT-100 Pro II was en route back to the mother ship for repairs. It now no longer comes with the Yaesu cable by default, only the Icom cable. There was a little green sticker on the destruction manual that informed me that the Y-ACC interface is now optional. But I would recommend the Z11 Pro II as well. Nice little tuner that works 0.1 to 125 watts and you can use it portable if you install a battery pack...what more could you want?

You can't go wrong with Z11 PRO II. Works well for QRP and QRO (up to 125W) its compact but has a lot of features and a decent price.

Philip, mine gives 1.87v at 100w into a 50 ohm load. That's pretty much the same, allowing for tolerances between diode lots. I don't have a service manual; Is this supposed to be a 1:1 matched condition?

Many thanks for the feedback.

Yes that is the the voltage with the the ATU into 50 ohms, and set to bypass (cap and ind switches pressed down).
Then the Input and output is swapped over and the REV test point set to the same voltage as measured on the FWD test point.

I built this from a kit back in 2003, but some how I have lost the construction notes, but LDG e-mailed me a copy. But no schematics.

Again many thanks Philip g7jur.

5087. 160 meter coil for S9 43'

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-11-27 17:24:03 UTC
From: johndave
Topic: 5087 Message: 5087

I bought a 160 meter coil from the original owner of S9. I have used it to make a contact, and it works well.

It cost me $40. but I will sell it to anyone that wants it for $50.
delivered.

I want to return the S9 to multiband use by removing the coil. It's very easy to set up - simply install it between the green wire and the balun, and I have printed directions I received with it.

From: lowpowerop
Topic: 5088 Message: 5088

Ordered and received the Z-100 Plus but perhaps I should have purchased the Z-11 Pro. This tuner will be used mostly for qrp both at home and in the field. Will be tuning dipoles and ladderline doublets. I read in the specs the Z-11 Pro will tune up to 1000 ohm whereas the 100 Plus to 800 ohms. Also the Z-11 Pro has manual adjustment of L and C whereas the Z-100 Plus does not.

Like to hear from users the pros and cons of these two tuners.

thank you

5090. Power Supply for AT-200, 600 and 1000 Models

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-11-29 01:13:07 UTC
From: Dwayne
Topic: 5090 Message: 5090

Hi All,

We've had a few people ask about power supplies for the AT-200, 600 and 1000 series tuners. While www.cheapham.com carries a wall mount power supply for the 100 watt tuners, nothing is readily available for the higher powered tuners.

Many people use the same power supply that powers the radio, but not everyone has that choice if the power supply is built in.

After ordering many models and testing for a few weeks, we have chose to recommend a wall mount DC power supply from Jameco (www.jameco.com). The model number is 1953663 and costs about $15. It's 12 volts DC, 1000 mA and has a 2.5 x 5.5 mm, center positive plug on it.

Hi, there was a thread not so long ago where someone asked if we could have only one LDG tuner what one would it be, there was a unanimous response - the Z11 Pro. I have it and it is a wonderful piece of kit. I have or have had many LDG tuners, and it would be my one to keep if I had the choice. You can also put a battery holder inside the Z11, just like the Z100 and use it totally portable if needed.

With the adjustments, SWR range indicator and the amazing tuning range I would go with Z11 (if the seller will swap it over). If not the Z100 will give you a great service.

Thanks,

Mike

Hi,

The weight and tuning range of both tuners are almost the same (and both use latching-relays), so a choice comes down to the manual tuning or not. I have the original AT-11 and also the Z-11Pro, and I have to say that I rarely use the manual tuning capability of either one of them. When using a full-size 80m Carolina Windom, a wire 1/4 wavelength 80m vertical in a tree, or a 40m dipole fed with a 4:1 balun and wound around the inside and outside of my house, the auto-tuning of the tuners has always been my preferred method.

The RFConcepts / Alpha 4510 wattmeter is extremely accurate and has full-scale ranges all the way down to 0.3w, with analog AND digital readout. Each RF board is individually calibrated over temperature and frequency variations, too.

It's expensive, but it is a laboratory-grade piece of ham equipment!

73 - Glenn AE0Q

P.S. Yes, I do work at Alpha. I have run many of the wattmeters through their production calibration routine and they really are as accurate as the specs state!

From: lowpowerop
Topic: 5099 Message: 5099

Be aware when purchasing an LDG Tuner that states it will run off batteries there is no battery holder included and your vendor more than likely will not stock them. You must contact your local Radio Shack or other to find, purchase, and install.

I found one at Mouser.Com for $1.82 plus shipping for my Z-100 Plus.

Thank You

5100. Re: LDG Tuners come without battery holders.

John,

That is not entirely true. The Z-817 and Z-817H come with the battery holder already in place (but does not include batteries).

The Z-11ProII and Z-100Plus have the option for the user to add an internal battery pack if they wish. The manual for both clearly show that it is an option and how to install it.

Thanks for the Mouser info.

Subject: [LDG-auto-tuners] No battery pack for the LDG Tuners?

Decided to keep the Z-100 Plus tuner which I purchased. Took off the top cover to install the 6 AA batteries only to find there is no battery holder. Called the company whom I purchased it from to order the battery holder and they don't stock it and neither does LDG. So what does a customer like myself do? Called my local Radio Shack and they did not have one. Went to Mouser.Com and spent 45 minutes looking for one. Found one for $1.82 plus shipping.

So I have to find the battery pack, order it, and install it and as a customer I should not have to do this especially when it's advertised as "It will run on any voltage source from 7 to 18 volts; six AA batteries will run it for a year of normal use." There should have been a disclaimer stating "The battery holder is not included with this tuner. Customer must purchase and install it." I could then have made the decision to purchase or not to purchase.

The manual which was included with the tuner tells me the battery pack is optional! LOL. After I purchase the tuner then I find there is no battery pack.

LDG tuners are the best of their kind. I have used them. Four years ago I purchased this same excellent tuner which came with the battery pack installed. Perhaps the vendor I purchased it from did it on his own as a service.

Other's should be made aware they will have to do the leg work when they purchase any LDG tuner which operates on batteries. So be prepared to look for, purchase, and install that battery pack.

Will I buy LDG? YES.

Well it would be nicer if they would put the part number in the manual and state in their advertising that the battery holder is not included and the buyer must install it himself. Some people don't read the manual before making a purchase. On the other hand I purchased this same model three years ago and it came with a battery holder installed.
Thank You I am sure.

Subject: RE: tuning 20 meters with LDG pro II

Hi Mark,
Tried to respond to you off-line but the mail bounced as undeliverable!

For sure it's frustrating but that's transmission lines for you! As you've discovered, the impedance at the input to the co-ax feeder changes dramatically as you change bands. You don't mention whether you are familiar with EZnec and Transmission Lines for Windows (TLW). If you regularly "play" with antennas, it really is worth becoming familiar with both of these software tools as they will accurately calculate the co-ax input impedance on any band and the loss due to the co-ax having a high VSWR. Knowing the input impedance would enable you to determine what you need to do to get the impedance to a point where the LDG could produce a match where required.

If convenient, you could battery power the LDG and locate it at the base of the antenna, which would eliminate the feeder, then see how the LDG performs on each band. 20 Meters will still be high impedance but it will be mainly resistive and the tuner may just have the range to find a match. You could also experiment by locating a multi-ratio un-un e.g. 1:1 4:1 16:1 at the base of the antenna or at the operating position, after the LDG.

Short of using some other tuner having a much wider matching range, other options start to get a bit complicated.

In the past I have placed a relay (dc powered thro the co-ax,) at the bottom of a similar vertical which switched in a parallel tuned circuit on the band presenting the high impedance. When unpowered, the relay contacts are arranged to open circuit the matching network and connect the co-ax directly to the antenna.

Stick at it Mark, when you crack the problem you'll have a very effective antenna system.

Regards and 73,
Wes.
GW3RIH.

After using my AT-1000Pro for quite some time, I have a problem.
I started everything up as normal, Tune the antenna, then turn on the amp. Amp was set to about 700W into dummy load. Go in-line with the amp and I got a loud pop from the left rear of the tuner. In checking inside there are 3 parts that are showing smoke. R1, C2 maybe D2 and R2.
I love the tuner and have had no problems up to this point.
Any ideas what may have happened? SWR on all are still good. Radio still working fine.

Of all of the features of the LDG tuners out there you are going to return it because it does not have a $2 battery holder? Are there any other auto tuners out there that will work on a couple of AA batteries? This is a minor item, and with LDG not including it, I am sure it is because most users are not utilzing a battery pack, and as a company made the economical choise to remove it, and let the user impliment what ever battery pack they wanted/needed. Personally I would rather have this and be allowed to make my own personal choice on what battery I wanted to use.

5109. Interfacing an FT-890 to an LDG tuner

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: k2lrv
Topic: 5109 Message: 5109

My father owns an FT-890, and I am considering purchasing him an LDG tuner as a gift. The FT-890 has a tuner port on the rear tht has the following signals (pulled from the manual)

1) GND
2) +13V
3) Data
4) GND
5) GNDED by FC-800

The radio has the built in tuner, but is has the rather limited 3:1 range, making it not the best option for use with a single antenna usind on multiple bands.

What would be the simiplist tuner to use with this radio?

Thanks,

Lou

Yes. Well close enough anyway. The Elecraft T1 autotuner works on a single 9v battery.

Most modern radios run off of 12 volts so why not hook the thing to your radio power supply and forget batteries?

I'm thinking the Radio Shack was either manned by someone who has no clue about the stuff back in the parts bins, or Tandy, in their infinite wisdom, discontinued the battery holder. (I'm a former store manager, so excuse my tone..LOL)

P.S: I don't have the instructions from my Z-11 handy, but I think it
DOES mention you need to supply the holder.

I simply tapped off the power cord to my FT-900. Power supply or
battery, doesn't matter in my installation. Something to consider,
unless you were just looking to keep cabling to a minimum.

Subject: [LDG-auto-tuners] Re: Question about using ATU with TenTec Omni D

Hi Ronny,

Auto tuners will tune in SSB mode.. You still want to keep the power down.. You just have to whistle.. talk anything to get some power going out of the radio. So if you changed bands, or moved frequency in a band enough, as soon as you started taking, the tuner will start tuning if necessary.

For SWR protection, no mod is needed.. this is the way Ten Tec has done it with there rigs for years and it worked well. For base operation it is nice to use the Ten Tec Power Supply design for the radio. It has the built in over current protection. For mobile or any other operation without the TT PS get a fast action DC circuit breaker of the correct rating (18a). TT should still sell them.

The finals, (transistor for the person who mention tubes) are very rugged. As long as you do not exceed the max current, for a period of time, you will not damage the finals. This radio is not that picky what SWR it sees, it is the current you have to watch. If you have to, you can operate at lower power with a bad SWR and still get on the air. You don't hear much talk about blowing Ten Tec finals.

One example.. a Ten Tec Omni was used at school for the kids ham club. One day in the rush to leave the class something was accidentally knocked on to the CW key and not noticed. The rig was set for break in so it keyed.. It was over an hour before the teacher discovered the mistake shutting things down for the day. During the whole time the radio had been putting out a 100 watt carrier. No damage was done to the radio, it was not even excessively hot.

The power output is rated at 100 watts but I forgot that this is a very conservative rating, mine did more, especially with with an outboard Rf speech processor.. You may well want to look at tuners that have a 200 watt rating, to be on the safe side..

5120. My Tuner Saga

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-12-04 21:14:05 UTC
From: Tom Peterson
Topic: 5120 Message: 5120

Thought I'd share this with all of you.

I happened on a Icom 706MKIIg for sale on ebay. One of those buy it now deals. It came with an LDG AT-100ProII. Op selling it claimed that he thought the cable between the tuner and the rig was bad. The price was right for the radio alone so I went for the buy it now price. It showed up, I hooked everything up and it all seemed to work OK. The only issue it had was that the tuner didn't like to play on 15M at times. I lived with it. So what if I had to push the tune button on 15M twice every now and then to get a match. So far so good. I sold my AT-11 auto tuner...and let me tell you, I still miss that thing. I think I could have tuned a rock with it. I'm sorry I ever let it go. That was the best $50 I ever spent.

Well, after using the 100ProII for a while it suddenly started to refuse to tune on all bands. I checked the LDG website and it said that
> Non-warranty Repair
>
> 1. Average repair cost is $30.00. This covers most small parts. We
> will contact you with the cost for fixing your unit. The customer is
> responsible to pay for return shipping on non-warranty repairs

I could live with that, even though I swear I read that average repair cost was $50. I ordered a Z-11ProII to fill in for the AT-100 as it was affordable, would play better with my Flex 1500 for those times when I wasn't going to use my Elecraft T1, and would make a better back up tuner to use during contests with the 706 than my MFJ 949E. As soon as it arrived, I packaged the 100ProII and mailed it out. I also mailed out my form for a free balun for purchasing a new LDG tuner.

Anyway, 3 weeks or so go by and I haven't heard anything, but I'm not worried yet as I'm sure the post is getting bogged down with Christmas catalogs, Black Friday ads, what have you. Finally I come home from work and see that I have an email from LDG. Optimistically I open it. My hopes are dashed and my heart skips a beat or two when I read

> We have checked the AT-100Pro Tuner that you sent us for repair.
> Unfortunately, this unit is not repairable.

As Charlie Brown would say,
Arrrrrrrrrrrrrrrrrrrrrgggggggggggggggggggggggghhhhhhhhhhhhhhhhhhhhh!!!!!!!!!!

Further down, it said the following

> We can offer you a new tuner under our Replacement Program at a
> discounted price. Your tuner is a trade in towards the new unit. The
> costs for a new unit are as follows:

>
> Quantity Model
> Retail Discounted Price
>
> 1 New AT-100ProII Auto Tuner $
> 229.99 $ 85.00
>
> Shipping cost is $ 12.00 for UPS Ground, making the total $ 97.00.
>
OK, I was already planning on spending a minimum of $50 (even though the web site said average cost to repair was $30, I thought it said $50) I pulled the trigger and sent LDG the $97 for a band new tuner. It's on the way, my new balun arrived Thursday last, and my Z-11ProII is working flawlessly with my 706 and my 1500.

By comparison, I accidentally applied some downward pressure on the headphone jack on my Flex 1500 and broke it. Flex wanted $85 to fix it as it was literally days out of warranty. Oh well...nothing a little superglue to get me by until my 95 cent replacement jack ordered from Mouser gets here.

Thanks LDG for the great service and the great, well built, robust products.

Hi Tom,
LDG did much the same for me with a Z11-Pro2. I doubt that there is a better company of it's type out there and would recommend them to anyone.
See you on 15M!

Date: 2011-12-04 02:00:37 UTC
From: n4ndx
Topic: 5123 Message: 5123

I purchased this tuner about 1 year and so ago and just noticed that the unit is not tuning, the antenna is only tuning on the bands that were already pre-tuned prior to find out that it was not working properly. I have used my amp to a max of 630 watts on 20m a couple of times and under 600 watts on all other bands. Any suggestions???????

The tuners in the range LDG offer any advantages over conventional manual tuners, for listening SWL with the Kenwood R5000?

thank you

Jimenezjo, save your money. The LDG tuners require a RF transmitted signal to start a tune cycle.
Look at the manual tuners that MFJ and Veritronics (related companies) sell for SWL.
Some have a preamp along with the manual tuner. With one of those you can peak the signal at
what ever frequency you ar listening.
The advantage of the LDG is with changing transmitter frequencies and the tuner will automatically follow.
Not so with SWL. I use a MFJ - 1020A, older preamp type with short whip, or 40 foot wire, on my SWL receiver.
I also have the LDG AT 100 Pro for my transceiver tuner. Really a great tuner.

It's not going to tune unless you send some RF through it - so it wouldn't be appropriate.

I always wondered about the CAT based ones, would they track the frequency while I receive if have tuned that frequency? Which advantage could it be vs a "normal" one if RF is accessible in both to address the tuning?

With my FT-857D, when faced with the idea to have the CAT port busy doing the tuner thing, I decided for the AT-100Pro and never regretted the choice over the CAT based one (YT-100?).

When switching band, obviously the signals are not okay until I quickly transmit briefly, and this is one of the things maybe a CAT based tuner could avoid.

Why not download the LDG manual from there web site.Why not just call LDG and discuss it with them.

The LDG manual tune mode on mine(KT100 model) specify's a low power cw mode to tune when not using the auto mode.

Maybe your 5 watts is too low to activate the tuner

Subject: Re: [LDG-auto-tuners] LDG Z-817 tuner problem

Hi Don,
I just tried holding in the PTT to transmit and then pushing the tune button on the LDG tuner but none of the LED's came on. When I originally started using this tuner the LED's were coming on but now nothing. Without a schematic I do not want to go poking around in the tuner unless I know what I am doing (even though I am a retired EE).
Any other suggestions?

Try CW mode. If you are just keying the PTT on the microphone on SSB you will have no output unless you are speaking. Either CW or AM modes should work fine as 5W is plenty for these tuners.

5134. At-897 tuner memory

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-12-18 00:53:58 UTC
From: rywessel
Topic: 5134 Message: 5134

Hi-

I just picked up a used Yaesu 897 with a AT-897 auto tuner with what appears to be a simple 1/8 stereo patch cable to connect to the ACC and the OTT jacks along with a ACC cable.

What I can't figure out is the how the At-897 stores and recalls memories.

For example:

Select a band and frequency (I will call this #1) and I press the tune button on the AT-897 and searches for a solution resulting in a good SWR.

I go to another band frequency (#2) and re-tune. After 3-6 secs of sounds it tunes nicely.

When I go back to the original frequency (#1) and press the tune button momentarily. Nothing happens and the unit is still tuning to the #2 frequency. I press for a bit longer and it goes for 3-6 secs to tune.

I can't figure out how to get the quick 1/2-1 sec memory tunning.

thoughts?

thanks,

robin

Hi Robin. If you have an original AT-897, it has no memory. You will have to tune it at every change. Still a very nice combo, though. I use that same combo for my portable ops.

Thanks for the info.

Bummer. . . However it does tune.

I thought I did my research before I bought it since the manual says it supported memory tuning. For the few bucks I saved, I could have bought a newer one with memories but it appears that it is difficult to know if it supports it or not since there is no model number distinction.

Can this unit still be upgraded? From the archive it appears that there is a replacment chip.

thanks,

robin

Robin,

Actually the short/quick press of the tune button takes the tuner out of circuit. Unfortunately the design of this tuner does not allow for any indication that you are, in fact, in bypass mode.

Topic: 5134 Message: 5139

Hi Ken,

That's close, but all AT-897's have some sort of memory. You are correct that on all AT-897's you must tune it at every change.

The difference is the older AT-897 (plain) has a stack memory of about 200. That is, if it finds a match, it simply stores it. When it finds another match, it increments a counter and stores it in the next spot. When it reaches the final spot, the counter starts over. So you continually have the latest 200 memories stored.

In this method, when you do a memory tune, the most recent memory is recalled and it goes backwards through the stack until it find a match. This takes about a half second.

If no match is found, the tuner will do a full tune (2 to 6 seconds), and store it at the current counter's spot if it's a good match.

The newer Plus model uses a frequency counter and stores the memories by frequency. So when you tune to 7.100 it saves it for 7.100 (+/- 50 KHz). When you do a memory tune, it looks at then memory position for 7.100 Mhz. If it does not find a match, it does a full tune and saves it in the position for 7.100.

Hope this helps clear the differences in type of memories.

Just a small update this month. We added videos for the Z-11ProII and an update video for the AT-200ProII.

We also regrouped the tuners into Generic models and Radio specific models. Hopefully it will easier to find the information.

**

You'll be fine. 5:1 SWR is a piece of cake for an LDG tuner as well as other well designed tuners. That is the whole idea behind this S9v antenna design and others like it; use a 4:1 Unun which brings the feedpoint impedance across the HF Amateur Bands down to a level the tuner can handle. Using either a short or very low loss longer coax from the Unun to the tuner will result in barely any feedline loss. The tuner could be mounted outside connected directly to the Unun to eliminate the small feedline loss but that is not necessary.

What tuner are you using? LDG I am guessing? I own a pair of them. Damn good quality. My portable setup is a 44' dipole fed with 300 ohm twinlead into a 4:1 LDG Balun then into a 10' length of RG-58 to a LDG RT-11 that I put the board in a aluminum case with external LED's & the tune button. It tunes 40m thru 6 meters like a piece of cake and gives me excellent signal reports with my '817ND :)

It is nice having companies like LDG to sell us affordable good quality products.

Happy Holidays,
Mike-WE0H ..

Hi Dwayne,

Thanks for the info. I am a subscriber of yours on YouTube. If you ever wanted anecdotal evidence this new media helps sales here goes...

I purchased an AT-200 Pro earlier this year, before the pro II was released or at least available from my dealer. I saw the pro II on your website and in dealer ads and thought nothing off the extra LEDs, until I saw the video on YouTube.

I saw the need to switch antennas to see which one I was on was not needed, and then thinking I would really like to know when the tuner is running in bypass mode. I bought the new model the same evening as watching the video and subsequently put my less than one year old AT-200 on eBay (it is currently on there now with 5 days to go).

I have received the AT-200 Pro II today and look forward to using it, along with my other LDG tuners, the Z11 Pro II and the Z-817H. I have also had the pleasure of owning the AT-100Pro and the standard Z-817, only sold because of upgrading to newer/bigger LDG products.

Big fan of the products, and thanks for the insightful videos.

5148. Remote Tuner

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-12-23 17:44:31 UTC
From: n0we
Topic: 5148 Message: 5148

This relates both to my Z100+ tuner and my S9 antenna. I am thinking about using my tuner remote (next to the antenna). This will br for portable operation only. LDG shows you how to make the remote switch. I will be using this with a Yaesu 857D. My question is can I extend the Yaesu interface cable 50' and still have it work. If all it's doing is shorting out the circuit I should be fine. I am not exactly sure how it works. From what I read if you hit the tune button on the tuner it will make the radio sent out a low power tone.

Jim,

You should be able to build what you need and have it operate 50 feet away. Use at least # 20 wire with shield.

Connecting a control to the ACC port does not lower the RF power when tuning. However, that is fine as the radio will lower the RF power any time the SWR is high (that includes when the tuner is tuning).

5151. AT600Pro tuner interface

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2011-12-28 20:04:24 UTC
From: Stefan
Topic: 5151 Message: 5151

Hi,
I just got AT600Pro tuner and trying to interface it to my TS-2000 and ALS600 PA.
After reading your interface app. note, tried to build interface with PIC micro and I'm running in 2 major problems.
1. Making a 75ms pulse on START line will put the tuner in Bypass. The problem is that next 75ms pulse will turn it back online and there is no way to tell get the actual tuner status. I can't find a way to safely put the AT600Pro in bypass.

2. Using AT600Pro in Auto mode can trigger tune cycle at any time and KEY line will be not pulled down as described in app note. In auto mode there is no way to tell that tuner is actually tuning and switch PA off-line. Operating in SSB mode, tuning cycle can start at ANY time and power level, which is definitely not safe. I put the tuner in semi-automatic mode, because I want it to tune ONLY when started with external pulse AND with amplifier bypassed. Then I made following sequence:

Press tune button (or CAT command) on TS-2000 to start tune cycle
Pull AT600Pro START line low and switch PA in STANDBY
90ms later TS-2000 will start transmitting 10W carrier
After 500ms release START line to start tune cycle

Problem is that AT600Pro is not responding to this external command by pulling KEY low and there is no way to tell when tune cycle is completed.

At this point I'm stuck and can't resolve this problem... Please help.

Hi Rick N8MFN

Put that question to the LDG tech support staff to get a proper answer.

Maybe you can get a cheap upgrade you won't know if you don't ask the manufacture.

They will give you better opinions as they know the gears history etc and compatibility with the various radios and nobody will be guessing or offering opinions that are possibly hearsay.

5157. Z11Pro2 Temp senstive?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-04 04:37:36 UTC
From: mdgolfbum
Topic: 5157 Message: 5157

I'm finding my brand new Z11Pro2 to be temp sensitive. It won't tune below about 5:1 if cold but if I bring it in the house and let it warm up then take it back out it remembers it's proper tune for that frequency range and hits 1:1 no problem.

It's like a relay is stuck or something.

Does this sound plausible?

Date: 2012-01-06 14:25:00 UTC
From: VE3YF
Topic: 5158 Message: 5158

With the amount of people that have had to replace their Meter Lamp and after viewing the Youtube video on the procedure to replace it, I am going to bring down the voltage to the lamp. Does anyone including Dwayne know what voltage goes to the lamp. I am presuming it is a 12v lamp but without opening up the case to investigate, thought I would ask the question here. Another thought is to use a LED, has anyone tried to use a LED and if so how does it work out. Thanks.

Mike,
I added an 7809 volt regulator (3-terminal)to the circuit in order to reduce the voltage to the lamp and to reduce the affect of 12 VDC voltage fluctuations from varying the lamp's intensity. This was accomplished with an add-on circuit using the connector on the PCBA just below the meter. It is normally driven from the 12 VDC source that feeds the autotuner. I will be happy to send you a photo of the circuit installation.

Hi Mike,

It's 12 volt DC bulb. However many people connect the tuner to the power supply that also runs the radio which is usually 13.8 volts. That causes the bulb to burn out quicker. Even if someone uses an external wall wart, an unregulated DC voltage can float around 15 volts and will burn them out pretty quickly.

We have asked the meter manufacture to convert to LED, but the samples that we got were unacceptable due to the very low emitted light.

So right now, we don't have good solution. I've added two 1N4001 in series to the bulb to drop the voltage by 1.4 volts and that seems to help some, but lowers the bulb intensity.

Looking back, we probably should have specified a 14 volt bulb, but then it would be pretty dim when used with 12.0 volts DC.

Hello,

We would need to know the PC board version and a better description of the location. If you could find some labeled components near the burnt resistor that would help.

Hi Dwayne,
The board AT-100 PRO VER 1.8
The resistor is R17 right next to VR marked R1.
I hope this helps.

Hello,

We would need to know the PC board version and a better description of the location. If you could find some labeled components near the burnt resistor that would help.

Well, it is NOT an AT-1000 pro! It is the first version of the AT-1000 with an upgraded IC chip

Udo,

We did not have an upgraded manual. We did have a couple sheets describing the new changes. I've placed a pdf in the files section of this group.

5175. Compatible Power Supplies for AT-1000Pro, AT-600Pro and AT-200ProII

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-13 23:33:41 UTC
From: Dwayne
Topic: 5175 Message: 5175

We've tested and approved two power supplies from Jameco, www.jameco.com, 1-800-831-4242.

These are #1953663 (linear) and #WM1012-760 (switching). Both are 12 volts at one amp and will work fine with the AT-1000Pro, AT-600 and AT-200ProII. The cost is around $12 to $15 plus shipping.

Topic: 5176 Message: 5176

Hi folks,

I have an AT100Pro and AT200Pro. I just bought an AL-811 a few days ago (haven't received it yet) and this morning ordered an AT-1000Pro to use with the amp. The last time I used any amp was an SB-200 in the 1980's when I had a Heath SB Line Station.

I now have numerous radios, all Icom. Except for two sets of Drake '4B' Line twins and the old SB200 none of which have been powered up since the 80's.

I look forward to gaining lots of knowledge from the group.

73,
Pete

Hi just hookup my 100 Pro II to an Icom 706. Every thing works as should except I cant get it to tune using the tune button on the radio. When I press the button I get a beep. I do have the interface cable attached. I just took out of line a LDG AT 11MP. It was great with it. Anyone have any ideas? Thanks Ricky KD4RFV.

Hi Ricky. The Icom 706 tune control doesn't work by itself- it was designed to work with the Icom automatic antenna tuner - it supports the AH-4. As you probably know, it reduces power to ten watts, transmits in CW mode to allow for antenna tuning. Without the Icom tuner, we need to tell the radio there is a tuner attached, or fake out the radio to make the feature work. Your AT100ProII, according to the instruction book, will plug directly into the 706 with a Icom interface cable. The tuner gets its power from that cable also- a nice touch.

I wonder whether you NEED any of that. According to the LDG manual, you merely attach the antenna cables (from the radio and out to the antenna) turn on 12V to the tuner, and begin to transmit in any mode. The tuner should automatically tune and you're ready to operate.

IF you want the radio to reduce power, switch to CW and give you ten seconds for tuning, you can use one of these:

The Better RF company (I don't know anything about them) has a tuner control for $32.

http://www.thiecom.de/ftp/ldg/acc11.pdf

The best discussion and schematic I found is here:

http://www.athensarc.org/706-Tune-control.asp

and here:

http://vss.pl/mods.dk/mods.php3-radio=icom
<http://vss.pl/mods.dk/mods.php3-radio=icom&model=ic-706&selectid=1864.htm>
&model=ic-706&selectid=1864.htm

Good luck! MY 706 has been wonderful mobile, worked all over EU from Ohio. But it now suffers from the power rollback that's been recently discussed. I highly recommend LDG, I have an AT-1000 and a Z-11 and excellent service and repair from LDG.

Hi,

I use an IT-100 tuner with my ic-706MkIIG. I can tune it from the radio. I don't have to tell the radio there is a tuner attached. The IT-100 works with any Icom radio that supports AH-3 or AH-4 Icom tuners

Subject: RE: [LDG-auto-tuners] Re: IC 706 and the 100PROII

Hi,

I use an IT-100 tuner with my ic-706MkIIG. I can tune it from the radio. I don't have to tell the radio there is a tuner attached. The IT-100 works with any Icom radio that supports AH-3 or AH-4 Icom tuners

Subject: [LDG-auto-tuners] Re: IC 706 and the 100PROII

Hi Ricky. The Icom 706 tune control doesn't work by itself- it was designed to work with the Icom automatic antenna tuner - it supports the AH-4. As you probably know, it reduces power to ten watts, transmits in CW mode to allow for antenna tuning. Without the Icom tuner, we need to tell the radio there is a tuner attached, or fake out the radio to make the feature work. Your AT100ProII, according to the instruction book, will plug directly into the 706 with a Icom interface cable. The tuner gets its power from that cable also- a nice touch.

I wonder whether you NEED any of that. According to the LDG manual, you merely attach the antenna cables (from the radio and out to the antenna) turn on 12V to the tuner, and begin to transmit in any mode. The tuner should automatically tune and you're ready to operate.

IF you want the radio to reduce power, switch to CW and give you ten seconds for tuning, you can use one of these:

The Better RF company (I don't know anything about them) has a tuner control for $32.

http://www.thiecom.de/ftp/ldg/acc11.pdf

The best discussion and schematic I found is here:

http://www.athensarc.org/706-Tune-control.asp

and here:

http://vss.pl/mods.dk/mods.php3-radio=icom
<http://vss.pl/mods.dk/mods.php3-radio=icom
<http://vss.pl/mods.dk/mods.php3-radio=icom&model=ic-706&selectid=1864.htm>
&model=ic-706&selectid=1864.htm>
&model=ic-706&selectid=1864.htm

Good luck! MY 706 has been wonderful mobile, worked all over EU from Ohio.
But it now suffers from the power rollback that's been recently discussed.
I highly recommend LDG, I have an AT-1000 and a Z-11 and excellent service
and repair from LDG.

Hi Jon, I wish it was that easy. The button will work with the older LDG AT11MP just not the 100ProII. I have 2 of the first model 706s Ive tryed and both are the same. But the 706MKIIG works with the button on front of the radio. Must be something with the early model 706s. Thanks Again Jon. Ricky KD4RFV

Ditto...
Just hit the tune button on the radio and away you go.

Jon,

We have already provided input to him.

There is no difference in the Tune button circuit between the 706 (plain) and any other versions. Except on the 706 (plain) the tuner button does not function on 6 Meters and the newer 706s the tuner button will function on 6 Meters.

5187. AT100 PRO II- Questions on my observations during operation.

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-21 16:17:00 UTC
From: stereoimage73
Topic: 5187 Message: 5187

Hello:

Purchased an AT100pro II from AES last week while my AT897pro is being repaired. Radio is a Yaesu 897D and I have the Y-ACC cable.

Some observations that are not in the manual:

1. Bypass light flashes briefly at the start of a "manual" tune. Is this normal?

2. Can I use a standard 1\8" TRS "stereo headphone extender" to give me some length on this very short Y-ACC cable? The home brew diagram in the manual seems to reflect this.

3. My 897D has a CW carrier of 100w (shown on both the radio AND the tuner LED ladder) on 10 thru 20 meters. However on 40-80 meters at 100 watts CW output of 75 watts (as shown at the radio out) the TUNER shows an power output of 100 watts.

At 100 watts output on 40-80 meters (as shown by the radio) the TUNER displays blinking lights in a power output "over" state that exists.

4. Lastly, when connecting a durmmy load to the tuner on ANT 1 and ANT 2 it attempts to tune and then locks itself in BYPASS mode which I cannot disable. Is this correct functionality?

Thanks so much for any responses or opinions.

5188. Value of Resistor R17 in the AT-200 Pro Autotuner

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: Dave Watson
Topic: 5188 Message: 5188

I have an old AT-200Pro Autotuner. Upon opening the case and inspecting the components I noticed the resistor R17 is burnt. Looking through the LDG web site I don't see a schematic for it. I was hoping someone with a good AT-200Pro could give me the value of that resistor so that I can replace it.

Thanks,
Dave (W4DJW)

Maybe you can post a photo of the area of concern on the PCB. Did you have a lightning strike or use greater than 200W?

Dave,

I opened up my LDG AT-200Pro and found R17. In my unit it is a resistor with 4 color bands. The bands are:

Yellow, Brown, red and Gold. If my calculations are correct this makes the resistor a 4.1K ohm. I believe it is a 1 Watt resistor in my unit. The Gold band represents a 5% tolerance. the 4.1 K ohm is a non standard E24 Series resistor.

I hope this helps.

73,

Gene

Dave,

That is a 4.7K ohm 2 watt resistor.

5193. New AT-1000ProII announced

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-23 03:31:31 UTC
From: Dwayne
Topic: 5193 Message: 5193

Just a quick product update.

Coming in February. LDG has announced the AT-1000ProII. Building on the successful AT-1000 line of KW tuners, the new AT-1000ProII returns to simplicity, but adds the convenience of an optional 4.5" large, easy to read, LED backlit, analog meter with superior accuracy and resolution.

Suggested list price $539.99, Optional M-1000 Meter $129.99.

Manuals for the tuner and meter and hi-res photos are available on the website.

Autotuner

Dave,

That is a 4.7K ohm 2 watt resistor.

Subject: [LDG-auto-tuners] Re: Value of Resistor R17 in the AT-200 Pro Autotuner

Dave,

I opened up my LDG AT-200Pro and found R17. In my unit it is a resistor with 4 color bands. The bands are:

Yellow, Brown, red and Gold. If my calculations are correct this makes the resistor a 4.1K ohm. I believe it is a 1 Watt resistor in my unit. The Gold band represents a 5% tolerance. the 4.1 K ohm is a non standard E24 Series resistor.

I hope this helps.

73,

Gene

Pete, that same thing happened to me with the AT200 Pro. What I did was put it on eBay and buy a Pro II (I liked the idea of the bypass and antenna LED). Mad you might think, but the buyer of the AT200 pro paid a surprisingly big proportion of the MKII.

Depends how much of a benefit the new version is to you I guess and if you like keeping up-to-date or just need it to do the job - after all it will still do what you wanted it to or you wouldn't have bought it.

Just my 2 cents :)

5199. Z11Pro2 Match fail question

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-23 14:06:56 UTC
From: Jim Miller
Topic: 5199 Message: 5199

My new Z11Pro2 is not finding a match for my 160m antenna. It may not be the fault of the tuner. Upon not finding a match it always seem to end up with a SWR of 8.4:1. What does the Z11Pro2 do when it fails to find a match?

Does it leave the L/C matrix at the last tested configuration? Or does it switch itself out of the circuit?

Thanks

Jim ab3cv

From: doug pfaff
Topic: 5199 Message: 5200

what does the spec say for match range,my kt100 went to bypass because antenna was really close to 50 ohm match,it has a specified range listed.

a lot of new hams don't get the training to bring the antenna close to the 50 standard thru use of baluns un-un etc

the tuner keeps rig satisfied but the real work is from the antenna.

re your failure question ask Dwayne from LDG you get a better answer instead of a bunch of guesses

Hi Jim,

I have this ATU, as well as a bunch of others from LDG. When it cannot find a match that is acceptable the first 3 LEDs flash. It does not store anything as the tune was unacceptable, so sending another carrier will initiate a full tune again.

You can change the threshold to what the tuner finds acceptable, but they never go as high as 8:1! On this tuner, I have just skimmed the manual and the maximum is 3:1 (that is it will get to 3:1 and find that acceptable to store/not retune), so you need to make the antenna more acceptable to the tuner before it does it's work.

This tuner has a remarkable range so I would analyse your antenna without the tuner, as it seems that it is no where near a match at that frequency.

Good luck.

As I mentioned in the first message, I don't think the problem is necessarily in the tuner. I was just wondering what the tuner behavior would be under the condition of "no acceptable match found."

The tuner is remote. I really don't care what the LEDs do. I want to know what is the final state of the switch matrix. I want to know if it is passthru i.e. bypassed in the event of a match failure.

Sorry Jim, I didn't understand originally. I understand now - is it bypassed or stuck on it's closest match. That I don't know I'm afraid. I have always stopped transmitting pretty sharpish after not getting a match as to not damage the radio (the tuner out of its depth or in bypass the result is the same, I can't TX).

Dwayne or someone with more knowledge than me will have to let us know what state the matching network is when out of range.

5212. Yaesu FT-950 with LDG AT200 Pro II

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-25 00:24:12 UTC
From: m0saz
Topic: 5212 Message: 5212

OK so I am soon to be the proud owner of an FT-950, having downsized (with a bump) from an FTDX9000D. On the 9000 I just ran my AT200 Pro II in full auto mode and that was fine, and will be fine for the 950.

I was just wondering if there is a way of interfacing the radio with the tuner so the tune button on the AT200 causes the FT-950 to transmit in the right mode/power etc. to tune.

I could buy a YT-450 but not when I have a spare decent desk tuner with less than a few hours on the clock - plus it has the LED statuses and the twin antenna sockets :).

Any advice/wiring diagram would be appreciated.

Mike

Hi Group, I have the FT-817nd with a brand new Z817. Problem I have is getting the tuner to de-key the rig after a full or part tune cycle. The rig keys up in PKT mode does it's tuning thing then fails to release the TX. Only way I can get the rig to de-key is to lower the power on the 817. The antennae is multiband vertical and is designed for 6 and HF. Instructions carried out to the letter and new cells etc. I have no problem tuning on HF bands to note.

Mike,
Having owned a FT 950 and an AT 200Pro for a couple years now, I have found the easier tuning procedure is.....
1)Set Menu 112 (AM Xmit Pwr) to 10 watts or so and the LDG tuner to the auto mode.
2) Tune to the Freq you want.
3) Switch mode to AM.
4) Press the PTT button until the tuner finishes adjusting.
5)Switch mode back to mode of choice..
Once you set up menu 112, I find it quick and easy. Just a mode change and a PTT. Enjoy your new radio. 73 Mike KF6KXG

Topic: 5215 Message: 5215

I love my AT-200Pro but would love to find a way to interface it with the TS2000 so I would only have to push one button to tune. Presently, I have to go to AM (for reduced power) push the send button, let the tuner do it's thing and then go back to the mode I am using. I realize that LDG makes a unit for the Kenwood but it was more than I paid for the AT-200Pro (from a friend who upgraded his tuner so he could use an amplifier). There seems to be a cable connection for the Icom but nothing for the Kenwood. Anyone have any ideas??

Huh? With my AT-200 Pro and TS-2000 I just transmit and it (the AT-200 Pro) tunes, no button pressing or anything. I do this with the internal Kenwood ATU not active.

there is a patch cable for the ts50 rig to interface to the kt100 tuner

why not ask LDG about your specific rig maybe there all common to the Kenwood series

LDG use to make a Kenwood interface before they when to the concept of
rig specific tuners. Much better system IMHO but unless you can find
one of those interfaces on the used market you are out of luck.

You don't need to do all the steps you are talking about. LDG will tune
as soon as it detects any RF so all you need to do is whistle or even
start talking. A Trick I use to make sure it tunes quick is I have
memories for each band that contain the freq I want to start scanning
from (or band center). I then switch to that memory give a quick blow
on the mic and the tuner goes to that tune that it has memorized and I'm
ready to go from there. Much more convenient than switching modes and such.

BTW: I had the Kenwood tuner interface with my TS2K and it didn't work
right anyway. So I wound up using the above Technique. Now that I have
a Yaesu FT950 I still use the same technique and I also use the
technique with my FT857 in the mobile because the tuner is remotely
mounted so I can't push its tune button.

Hi Mike,

Thanks for the reply, that seems straightforward enough and my radio would be using AM for once lol. OK I will try that and I am sure that is fine.

Thanks,

Mike

Mark,

1) Bypass is just the state of the inductors and caps. It means zero L and zero C is currently in the tuning circuit. Since zero and zero is a possibly tuning combination, we try that during our tuning algorithm.

2) Yes.

3) Don't know. SWR and power meters in radios and autotuners are +/-10%, so they both could be right. Just to clarify, the tuner measures the power coming into the tuner from the radio, not going out to the antenna.
Many radios transmit various power levels on different bands. I've never seen one that did exactly 100 watts on all bands. It would not be unusual to see 107 watts on 40 or 80 meters.
We use Alpha watt meters (+/-2%) for testing and calibration(www.rfconcepts.com). At $750 each, it's way better than a Bird (+/-5%).

4) Yes, normal. If you tune a good dummy load, the proper solution is no L or C. Again, the bypass light is just the state of the tuning section where there is zero L and C. Press the Lup or Cup and the bypass light will go out since there is now some L or C in the tuning circuit.

Hope this helps.

5222. LDG 200 Pro vs LDG 200 Pro II

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-01-31 05:28:31 UTC
From: mlicht103
Topic: 5222 Message: 5222

When the new pro II came out I thought the only difference was the addition of bypass and ant choice LEDs on the front panel, but in reading the advertising, I now realize that they reduced the number of memories from 16K 3D memories to just 2K per ant switch position. Now in all honesty I probably do not need more than 2K memories but I was just curious. It seems LDG also eliminated some memory flexibility too. So my question is... Is this a downgrade or an upgrade? 73 Mike KF6KXG

5223. AT-100 Pro II - Some issues running constant carrier at 75 - 100W

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-02-05 12:58:47 UTC
From: Josh Mesilane
Topic: 5223 Message: 5223

Hi All,

I've had an AT-100 Pro II for about two weeks now (bought brand new) and I'm having some issues. I have sent a message to LDG via the contact us form, but thought I might ask here to see if anybody knows of the issues I'm experiencing.

My system is as follows:

45m doublet elevated 10m from the ground fed with "home brew" ladder line composed of 2.5mm^2 conductors spaced 60mm apart.
LDG 1:1 Balun
Yaesu FT-857D

So far I've had no issues with the tuner except under a single set of cirumstances, that is:

40m(Or 20 for that matter)/Data (PSK, Olivia, RTTY, etc)/75 - 100W

If I run 30W of Data or run SSB, the problem does not occur.

When transmitting for more than 30 seconds under these conditions, the SWR will start to raise, with no change whatsoever to the antenna or feed systems. The SWR gets progressively higher until it reaches approx 3:1, however does not go into the "Over" condition on the tuner. When this happens there is a noticeable ticking sound coming from the unit, however not the usual relay clunk. I noticed this evening an odd smell coming from the unit when it went into such conditions, and thought I would pop the case off to investigate, what I found was that the two centre inductors, and the two relays, presumably associated with these inductors had gotten warm, very warm. Too warm to touch. The hot glue under the inductors had also softened, although not what I would consider molten.

If given time to cool down, the high SWR condition goes away and normal operation resumes, until it gets warm again.

I know "100W" is a bit of a washy figure, however this happens any time the LED power meter reads above 50W, and the transmitter is keyed up for more than 30 seconds.

My questions are:

Does anyone run 100W of power on these units in a constant carrier modes?
If so, have you seen anything like this before?
Are there any suggestions as to if my setup may be to blame for this condition?

On a side note, apart from this particular set of circumstances the tuner is a fantastic unit. It can tune the doublet up at better than 1.5:1 on 80, 40, 20, 15 and sits around 1.7:1 on 10. I'm very impressed with the unit, it's very well finished, quite easy to use and even though I *could* use the Y-ACC cable, I haven't had the need as yet.

Cheers,

5224. AT-100proII HELP!

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-02-05 17:02:38 UTC
From: deputyjoel
Topic: 5224 Message: 5224

Hello group,

Just passed my General test and leaning about HF. I bought a used Yaesu FT-857D and bought a pre-built OFC Dipole (G5RV/Windom) design antenna for 6 to 40 meters. I also bought an LDG AT-100proII tuner. I didn't get the YT-100 for the FT-857D because the small SMD fuse that powers the CAT port was blown by the previous owner. So, on to my question, I followed all the directions with the tuner and made sure I had power, radio to tuner and antenna to tuner connections. I reduced the power and transmitted on 40 meters. The SWR bar was at max and there were clicking/buzzing sounds that made me nurvious and then the tuner went into bypass and turned off. I tried to read/understand the codes the tuner puts out but it was confusing to my newbie brain. I disconnected the tuner and checked the SWR with the radio and my LDG FT meter and it was about 2:1. I disconnected the tuner and ultimately made my first contact about 500 miles away! So, I am confused? I checked my coax, some new RG-8U, and it was good with no shorts. Interesting that the way the antenna is set up it has a 4 to 1 balun fed directly with coax and when I installed it I cheked and found that there was continuity between the center feed of the coax and the ground st the radio end. Confused due to my FM VHF and UHF equipment experience, I contacted the seller and he advised this was the way this particular antenna works. It does appear to work well and has acceptable SWR without the tuner. So, is it this particular antenna that is the problem with the tuner? I'm just trying to learn and figure it out! Thanks in advance!

5225. Protect outdoor tuner from lightning?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-02-05 21:12:07 UTC
From: kf5mmy
Topic: 5225 Message: 5225

I'm thinking about buying an auto-tuner, mostly so that I can move the end of my antenna out of the house. I am feeding 84 feet of wire from a manual antenna tuner that sits under my IC-718. So there is RF in the house. Although by using all the ferrite cores from the Palomar RFI kit it seems the RF is under control now ...

Anyway, I use a spark plug style lighting arrestor on the antenna wire outside the house now. Not sure if this will be adequate to protect electronics of an auto-tuner. Guess I could put something like an MFJ-270MF lightning protector on the output of the auto-tuner.

What do you folks that have an auto-tuner outside the house use for lightning protection?

Jim, KF5MMY

Hi,

I'm new here, but I've also got the same tuner (And the same radio, with the same blown fuse) and most of what you're asking about is more related to antenna theory than the tuner in particular.

I'll break this up into sections:

"The SWR bar was at max and there were clicking/buzzing sounds that made me nurvious and then the tuner went into bypass and turned off."

The clicking/buzzing noise is normal. The tuner works by switching various amounts of inductance and/or capacitance in and out of the circuit. The noise you can hear is the latching relays changing position, while the tuner hunts for the best match it can find. Did you release the key prior to the tuner finishing making noise? If you let it run full cycle (until it made no noise and the LEDs flashed indicating it had tuned) then *if* the bypass light was on, then the tuner could not find a better match than the antenna was already presenting to the radio, and so it "bypassed" the tuner connecting the antenna directly to your radio.

I disconnected the tuner and checked the SWR with the radio and my LDG FT meter and it was about 2:1

The antenna you're talking about I have not had specific use with, however I believe if it has been built and erected correctly it will provide a "near-enough" (in this case 2:1) match on 40m to use on a radio without the use of an external tuner. 2:1 won't cause your rig harm, and you will be able to make contacts (as you have) on this configuration.

Interesting that the way the antenna is set up it has a 4 to 1 balun fed directly with coax and when I installed it I cheked and found that there was continuity between the center feed of the coax and the ground st the radio end.

What you are measuring here is the DC resistance of the coils inside the balun. These will show a very low resistance at DC, however when coupled to an antenna (your G5RV) and fed with RF, the coil and corresponding antenna will present a very different impedance (resistance if you like?) to the radio. The tuner is designed to match this resistance to the 50 ohm impedance of your rig.

You may find that you don't have any problem at all, however I would expect if the antenna is presenting 2:1 to the radio without a tuner, that the LDG tuner should be able to match that 1:1 (No lights on the bottom bar of your tuner). Did you let the tuner run full cycle, or did you lift the key before the buzzing/clicking noise finished?

Cheers,
Josh

Josh, the tuner is rated at 100 watts PEP. Not continuous power.
Likewise the Radio is also rated same. Like AM mode, data should not exceed
perhaps 40 watts.
What you are experiencing is probably normal for any 100 watt rated tuner.
SSB and CW are intermittant moides and the heating doesa not rise to the
levels as continuous carrier.
Back down to 40 watts and you should be OK.
My LDG AT-100 PRO works well at that level.

Topic: 5225 Message: 5228

Jim,
First let me say that i do not operate when there is lightening.
Secondly, I disconnect the antennas when I am not using them.
And they are grounded after disconnecting.
That removes any need for lightening arresters.

I do operate a AT 100 PRO and I have both a Blitz Bug spark type
in the coax line at the tuner output and I have 50,000 (50K) ohm
resistors across the centerfed dipole antenna terminals at the coax
feed and also across the 300 ohm feed line on my 88 ft doublet.
This helps disappaate any static charge buildup.

I have had lightening hit about one half mile from my house and the
induced EMF in the antenna arced across a PL259.
Having worked 30 years in the Space industry in Florida, I can tell you
there is very little you can do to prevent lightening damage if it truely
strikes your antenna or the power or phone line.
There are grounding techniques that will surely lessen any damage.
We employed extensive means to prevent damage and experienced
lightening hits often on our 40 and 85 foot dish antennas.
However the best, most economical approach for most hams,
is as I explained at the beginning.

For your equipment, make sure that all are grounded to an earth ground.
I also disconnect the AC from the station with a large disconnect panel so
hopefully if the power line does get hit, the voltage will not seek a path
through my equipment.

In 60 plus years I have not had a direct hit on my station.
However I have experienced several near hits and high induced EMF.
Others may have differing opinions, but so far it has worked for me.

Hi Don,

I concur with you. In my earlier career in Ham Radio I had an AT-100 pro and had a go at data modes (doesn't interest me but I thought I would try it.) I had the same flash-over that Josh mentioned, running PSK at something like 75+ watts. Not good, but incredibly the tuner continued to work after with no faults. I now have an AT-200 pro II, so in theory, if I was to do data modes, I could run a lot more power but alas CW/SSB is my only interest.

Lesson learned!

Mike

I agree with everything Don said. If you stick around the hobby long enough and live in an area that gets thunderstorms, you most likely suffer from lightening eventually. In addition to his advice the next best thing to do is buy insurance. I think the ARRL is still offering reasonable coverage. Last time I got hit, my household insurance covered some of the damage, but the deductible is pretty high.

Apparently you did NOT learn the real lesson; today's 100 Watt rigs are designed for a PEP rating, and if you drive them with constant output at that level (as the digital modes do) they rebel. ALL the digital mode instructions I have read say to power down, to stay within the ratings. What do the Specs on your rig say about allowed FM power level?

Thanks for the feedback, Jim and Don.
I short my end fed wire antenna to ground wire now with a knife switch when I am not on the air. No problem with the manual tuner on the desk under my transceiver. And the spark plug lightning arrester is outside the house, bolted to the top of a ground rod. But if I get an auto-tuner and put it outside at the base of the antenna ... I need to think about how to do this so that the auto-tuner is protected from the weather, and so that I can still easily disconnect the antenna from the tuner and connect the antenna to ground.

Thanks for the reply Josh. I did let the tuner run full cycle and it went into bypass. Since I am new to HF and automatic tuners, I was unaware that they made such a racket! If this noise is normal and if my antenna is already a good match and the tuner is suppose to go into bypass, then all is well. I appreciate your help. I thought there was something wrong with my tuner!

Subject: [LDG-auto-tuners] Protect outdoor tuner from lightning?

I'm thinking about buying an auto-tuner, mostly so that I can move the end of my antenna out of the house. I am feeding 84 feet of wire from a manual antenna tuner that sits under my IC-718. So there is RF in the house. Although by using all the ferrite cores from the Palomar RFI kit it seems the RF is under control now ...

Anyway, I use a spark plug style lighting arrestor on the antenna wire outside the house now. Not sure if this will be adequate to protect electronics of an auto-tuner. Guess I could put something like an MFJ-270MF lightning protector on the output of the auto-tuner.

What do you folks that have an auto-tuner outside the house use for lightning protection?

Dear's,

im planning to buy a Yaesu Ft-857.
I wish to use digital mode psk31.
I understand that the AT-100 is Ok but some one suggest to use
the AT-200 for digital mode because admit more continous power.

What do you think ?

Thanks a lot.

If you plan on using the 857 at full power, sure, but no one with psk31 experience is using more than 20 watts. I use 5 watts all the time and have no problem communicating with anyone I want.

I'm sure someone will pipe in with a different opinion but I assure you psk31 works quite satisfactorily at low power.

5239. High SWR reading on my AT-100Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-02-11 01:28:24 UTC
From: TomW
Topic: 5239 Message: 5239

Good Evening to Everyone,

I recently bought a new back-up rig. It is an Icom IC-7200. I had the AT-100Pro on the shelf for several years. As I had an interface for the Icom I decided to use this tuner with the new rig. My main rig is a Yaesu FT-950 going through an LDG AT-1000Pro tuner. I use the same antenna with both rigs. after tuning, the AT-1000Pro shows a flat SWR. The AT-100Pro shows an SWR of 1.7:1 on the Icom. The onboard SWR meter on the Icom shows a flat SWR,and the Daiwa CN-801HP also shows a flat SWR. Both tuners seem to be working. My question is, should I believe the AT-100Pro or the onboard and Daiwa meters.

Thanks
Tom de AC8JT

Topic: 5239 Message: 5240

The AT 100 PRO may be working right. There is some tolerance in all measurements.
However, the AT 100 PRO has a setting for SWR. If it is set at 2.0 then the tuner will stop anywhere below that setting.
But if you set it too low, say 1.5 then the tuner never shuts-up and the noise is very annoying. Especially to my wife.

So check the manual again and verify that it is set where you want it.
Bottom line, If it is truely anywhere below 2 to 1 the radio could care less and you still have little loss.
Mine is set for 2.0 to 1 and it tunes only when I make a large frequency change.

Although the AT-100 will be more than adequate for the FT-857, I would get
the AT-200, for the possibility of future need.
However, you should NEVER run the FT-857 at full power in the digital modes.
PSK31 is a continuous signal mode, so you should limit power to the ratings
for FM or AM modes Most people run at 40-50 Watts.

Hi,

I recently went down this road. *The AT-100 Pro II will NOT handle a 100W carrier. The inductors WILL get hot, you WILL hear flash-over noises from the unit and the SWR WILL go through the roof.* The unit however did recover in my case, once allowed to cool down.

The FT-857 (Which is the radio I run) will also get quite warm, although if your fans aren't worn or full of dust it *should* be able to keep the unit cool enough to cause it not to fry, at least not straight away anyway.

I've found that running 30-40w (40W Max!) of constant carrier is all the AT-100 Pro II can handle before it start to get hot and grumpy.

The difference between 30 and 100W is only 5.2db (and 3.9db in the case of 40W) which is going to be good for maybe 1.5 S points at best and on a mode that works really really well in noisy environments you probably don't need the 100W.

Cheers,

Hello,

John and Bill are correct. The 125 watt rating is for PEP. You should half that for high duty cycle modes and reduce it even further for continuous duty modes like RTTY or PSK.

Likewise for the radio. You can get by a few times running the radio at full power for long periods, but eventually it will fail.

The design of LDG tuners use toroidal cores that are fairly unforgiving in this respect. If you heat them, you may hear the glue melt or pop before the inductor fails. In this case only, letting it cool may allow the tuner to work again.

However, if the cores themselves overheat, the characteristics change and are not reversible by time.

So the responses are correct. Lower the RF power for continuous duty mode to save the tuner and the radio.

Even if you got the 200ProII, you will eventually fry the radio.

Thanks all for answer,
I know that i should lower 857 poewer.
So if i use 30 or 40 watt i'm confident with pro 100 or did you think will be better at pro 200 ?

Thanks, Giorgio.

Thanks Gene and Dwayne! I had to order the 4.7k 2 watt resistor and it came in while I was building an SDR radio kit so it had to wait until the bench was cleared. Just installed it this morning and the AT200Pro Autotuner is back in service and back to its old self doing a fine job. Saved me $260!

From: Dwayne
Topic: 5251 Message: 5251

Just a quick update for this month.

The AT-1000ProII should be shipping next week (the week of Feb 20). We know there are a lot of people excited to see the new product and we apologize for the delay.

Part of the problem is we are having construction to add more space (we really need it), so production and repair times are suffering. Also we're doing final inventory (we go through January).

The M-1000 matching meter for the AT-1000ProII is slightly behind the tuner, so it should be ready the first part of March.

So, we'll get the 1000ProII out very soon and sincerely apologize for the longer repair times. We pride ourselves in trying to providing the best customer service possible and the new space will allow us to get repairs turned around even faster in the future. It will help immensely in the long run, but is causing delays during the growing phase.

Thanks for everyones patience,

Dwayne Kincaid
LDG

5255. Z-100Plus Has Quit

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-02-18 10:36:31 UTC
From: jbblack68
Topic: 5255 Message: 5255

Good morning. New to the group, but not new to LDG products.

My Z-100+ of almost two years has quit. When I press the tune button, no LED's come on, no tuning cycle starts, nothing. All I get is a whine which appears to be coming from one of the relays.

Problem is that my hearing is not what it once was. I took a toy stethoscope to try and verify which relay, but I cannot narrow it down - not even completely certain it's a relay.

I think the tuner has a two year warranty on it which will be up in late March or early April. If I send it in for repair, I'm out a tuner. Has anyone run across this? Any troubleshooting tips? How is LDG's service (I love their products) if I need to send it back?

73,
Joel - W4JBB

5256. Re: [LDG-auto-tuners] AT-100 ProII & AT-200 ProII (PSK 31 POWER OUTPUT COMMENT)

From: doug pfaff
Topic: 5237 Message: 5256

check the units manual for power out on Digital or FM

REFER TO THIS LINK HAVE COPIED HIS COMMENT BELOW http://www.mymorninglight.org/ham/psk.htm

In my humble opinion, PSK31 is one of the BEST digital modes on Ham Radio! In the same bandwidth as ONE SSB conversation, there can be literally DOZENS of "keyboard-to-keyboard" text QSO's. Because of the extremely narrow bandwidth (31Hz!) you don't need a lot of power to have a good signal. Most DX PSK31 contacts are made with power levels at or below 30 watts!
As a default "standard", 20 watts is considered a "normal/maximum" operating power. Because PSK is so efficient, it is almost never necessary to run more than this. For this reason, QRP operation on this mode is common. (There is also PSK63, which is a faster version of PSK31, but it does not seem to be very popular for some reason!)

I won't be going into the technical details of HOW PSK31 works. Here is another site, explaining the details of PSK31, how & why, etc! It is very well written. Now, when it comes to the math involved with the actual encoding/decoding... I just scratch my head! ;) It's quite beyond me! BUT, one doesn't have to know everything that's "under the hood" to drive a car, right? :) Let's just get to the BASICS of PSK31!

Think of THIS PSK31 Elmer page as more of an "operator's manual for the Layman" (PSK for Dummies???) to help you (and others) get the most out of this wonderful mode! Most importantly, there's nothing nicer for EVERYONE than a CLEAN signal! :) It is my full intent to help you become a "PSK Elmer" who can help other users of this awesome mode to get much more benefit and enjoyment from it!

If you plan on using the 857 at full power, sure, but no one with psk31 experience is using more than 20 watts. I use 5 watts all the time and have no problem communicating with anyone I want.

I'm sure someone will pipe in with a different opinion but I assure you psk31 works quite satisfactorily at low power.

5257. Replacement Components for YT-100

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-02-27 04:11:04 UTC
From: Joseph
Topic: 5257 Message: 5257

Greetings Gang,

I'm new to the group, but I've had a YT-100 for a few years now, and it works flawlessly. However, While I was installing a home brew remote switch the other day, the jack on the back of the unit broke when the tuner fell from the bench. (long story, involving an excited puppy, and a PITA XYL). Anyway, the 3.5mm jack will need replacing. Now, it's a simple enough repair, but the component itself seems fairly unique. Does anyone know of a source for replacement parts? OR, does LDG sell parts? I'd hate to have to ship the thing back, wait 6 weeks and pay $30 for replacement of a $3.00 part that I could replace myself. Thanks!

73~

Just a quick update to the minor update. The AT-1000ProIIs have been shipping for a few weeks and the M-1000 will be shipping next week.

The construction is finally over and the repairs from February are caught up. Why is it that construction estimates are always low? It took 4 and a half weeks and the original estimate was 2 weeks.

Thanks for everyone's patience while we were getting back on track.

Just in case you are wondering about the new AT-1000ProII and the M-1000, we have added new videos to showcase the benefits of these units.

The AT-1000ProII can be viewed at:
http://www.youtube.com/watch?v=--EzcNnvT5o

The new cool optional meter can be viewed at:
http://www.youtube.com/watch?v=3-Wnj78an0A

It's worth a few minutes to see the new direction we are going with higher powered tuners.

Hi Mike,

The AT200Pro can run in fully auto mode (how I run it on my FT-950). Just transmit and it will tune, you don't need any interface leads.

A whistle on SSB will kick it into action, or a flick down to an AM carrier will also do the job.

I hope that helps.

Does anyone else notice that it doesn't seem like the tuner really memorizes a tune? If I tune my dipole and then switch to the loop and tune, when switching back and forth the tuner goes into a tune sequence again. The way I tune is to switch to cw mode,key the mic and turn the drive up until the 5w led lights up and let the tuner do it's thing. Rig is a Yaesu ft757gx2 and the tuner is powered from the radio. Any thoughts?

Hi Mike,

That is correct. All the interface lead does is start a carrier on the RTX for the tuner to do its thing. But if you can cope with the radio initiating the tuner, which is perfectly fine (read the manual for verification/to feel sure) just use it in full auto mode.

Dwayne at LDG often contributes to these posts and might be able to offer an interface lead for the TS-480 but it is certainly not required.

The tuner runs to a 4-position switch,I'm only using one of the positions on the tuner itself. I don't see why that would make a difference in it remembering tuner settings tho.

That's why LDG developed the AT-200 Pro II..so you can use auto-tune and not NEED to use
a interface cable anymore. That's like asking Icom to retrofit a 735 to do what a 756 Pro does!
It just isn't going to happen. Be happy with what the Pro does do. There is no money to be made
by adapting older technology to "attempt" to do what the newer designed stuff does.
You have a great thought, just a bad idea from the money making side of it.

P.S. I have a 200 Pro II on my 735 now, it just whips the crap out of the AT-150 Icom Auto
Tuner made 25 years ago. Covers a wider range of higher SWR's, and it tunes 70% faster too.
However, being a ham for over 34+ years..I am keeping the old Icom to sell with the 735. (IF I
ever do.) A matching auto tuner & power supply brings in a few more dollars when you do go to sell it.
(The SM-10 equalizer esk mic for the 735 now goes at over $200-when you can find one for sell.)
Like Mike said, Dwayne at LDG can help tell you how to make a cable for the TS 2000 to the
200 Pro, if you still desire to go that way.
73, es enjoy the hobby!

Well, if you think about it, it stores ONE tuning setting per antenna port per frequency. If you connect a dipole to ant1, tune it up, it will now save that setting. If you then go and change the antenna on the ant1 port, all the tuner knows is that the SWR has gone high and a tuning cycle will start. It has no idea that you have a different antenna on it, so it will try the previously known good tuning setting (the one it saved for the dipole), fail, and initiate a full tuning cycle.

The whole point of having two antenna ports is so that you can use two different antennas and as such, two sets of memories (one set for each antena port) if you're using an external switch, the tuner has no idea, and as such a lot of full tuning cycles will take place each time you tune the antenna.

Bill, Yes automatic makes sense but only if I put some RF to it first otherwise the relays bounce all over the place, especially in SSB. I apply about 25 watts in AM to get the unit to tune "automatically" and then go back to SSB mode (or CW). Then it is much quicker and no long relay chatter. The tuner just doesn't react quickly enough to SSB. Or for that matter to 20 WPM CW. A way to "automatically" lower the power on the TS2000, adjust the tuner and then go back to the operating mode would be ideal. The unit I received came with a cable to adjust the Icom to do that. Why not a Kenwood cable?

Agreed Dave,

I have been using the AT200Pro II with my FT-950 for months now, and because I have been up and down all the bands in the course of my operating, the memories on the tuner mean that most of the time, the tuner just clicks into a match.

The interface cable on most auto atu's seem to just open a carrier when you push the tune button on the rig or the tuner and does it's thing and turns off the carrier. Some of the more paired ATU's track the frequency like some amps.

Many thanks,

Mike

Bob,

How about something like this:

http://www.universal-radio.com/catalog/hamtune/15012050.html
http://www.radioworld.co.uk/catalog/ldg-kenwood_one-touch-tune-p-3945.html
(UK and US link)

You would have to check with the reseller/LDG if it would work with the TS-2000 and a more modern tuner in the LDG range such as the AT2000 as it does say FT-50 and AT-11 but there is sketchy info when searching the web about the OTT Kenwood model being used on the TS-2000 and with other tuners...

Worth investigating. Universal Radio lists it as discontinued but Radioworld don't so they might have some/might ship if it is suitable.

I apply about 25 watts in AM to get the unit to tune "automatically" and then go back to SSB mode (or CW). Then it is much quicker and no long relay chatter. The tuner just doesn't react quickly enough to SSB. Or for that matter to 20 WPM CW. A way to "automatically" lower the power on the TS2000, adjust the tuner and then go back to the operating mode would be ideal. The unit I received came with a cable to adjust the Icom to do that. Why not a Kenwood cable?

I had the Kenwood OTT with my TS2K. It did not worked correctly. The only thing it gave was powering the tuner from the radio. I called LDG and they said the OTT was hit or miss with the TS2K.

Having the ott working allows you to start a tune using the tune button. Handy but not needed.

5289. FT 817 Tuner Problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-03-15 17:07:44 UTC
From: jackson_norman
Topic: 5289 Message: 5289

I am having a problem with my FT-817 Auto Tuner. It tunes all frequencys except 40 M. When I try tuning 40M on either of the two antennas that I use, the red light blinks for a few seconds and then stays on for a couple more seconds along with two beeps from the radio. After the red light goes off and the rig goes back to the receive mode, I still have a very high SWR when keying. My two antennas are an OCF 80-10 dipole, and a 40 M OCF commercial antenna. Can anyone tell me what the problem might be? Thanks, Norm/K1NAJ

Hi all,

thanks to all who replied to my thread about if i could use the ldg at200 pro on my ts480hx

will connect the atu up to the ts480hx at the week end and do some tests, i find this atu alot better user

freindley then the mfj gear.

Mike m0fcg

Hi Mike,

That is correct. All the interface lead does is start a carrier on the RTX for the tuner to do its thing. But if you can cope with the radio initiating the tuner, which is perfectly fine (read the manual for verification/to feel sure) just use it in full auto mode.

Dwayne at LDG often contributes to these posts and might be able to offer an interface lead for the TS-480 but it is certainly not required.

Put the tuner in bypass and check the SWR on both antennas. This will let you know if the impedance is out of range for the tuner. Also try it at different points in the band. The 40M OCF should be resonant somewhere in the band.

Sometimes something as simple as adding a short piece of coax can help

5293. N4YG SmartKeyboard and Logger 32

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-03-20 09:41:58 UTC
From: bsip_9
Topic: 5293 Message: 5293

Hi all,
For 5/6 years now I have been running Logger 32 and would not willingly change to another logging program. For about three years, I have also been running the N4YG SmartKeyboard(SKB)and from day one have experienced the minor annoyance described as follows: Consider that I have logger 32 and the GUI for SmartKeyboard on-screen at the same time. If I make any change to the Logger 32 GUI (say to enter a callsign,)the SKB GUI disappears to the taskbar and I have to re-open SKB in order to display the SKB GUI.

Is there a checkbox or Menu etc. within Logger I can go to to prevent this happening.

Any advice will be much appreciated.

Kind regards,
Wes.
EA5/GW3RIH.

It seems to me that a better algorithm would be to keep two settings per frequency but not to attach the setting to a physical switch. That way you could use an outboard switch if you wanted to and get the same effect. Logic might look like:

Try the setting for this freq the last time it (the frequency) was used. If swr not ok then try the second setting for this freq. If swr still not OK retune and save as "last setting for this freq". Retaining the previous primary setting as the secondary.

There's no reason that this alogorithm couldn't be extended to more than 2 settings.

I don't know how much intelligence the computers on the tuner have, but I do/have programmed a number of the current crop of processors and they are pretty powerful these days. You've got more cpu/memory in a chip smaller than your thumbnail than the biggest IBM 360 had.

Hi Siso,
Have you tried the TRANSLATE facility in Google?
If you load the manual into your computer,COPY it then open Google translate. Select English to Spanish and paste the manual that should do it. I've just done the same thing with a door alarm manual and it worked for me.
Hope this helps.

5300. New LDG Z11Pro2: behaviour during tuning surprises me...

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-03-26 05:47:08 UTC
From: pe1kel
Topic: 5300 Message: 5300

I bought a brand new LDG tuner, the Z11PRO2.
Firstly I read the manual and after that I started the auto-tune.
What was happening surprised me, I heared the sound of a rattlesnake inside the tuner.
All the relais were activated in sequence in a fraction of a second, and this during about 6 seconds.
The tuner did the work, the swr was adjusted very well.
Now I am curious how long it takes till I can sent the tuner to LDG for replacing some relais...
Does anybody recognize this ?
To my opinion I prefer the good old manually adjustable tuner with the big variable caps and manually switchable coils if I compare.
I wonder that I own this Z11Pro2 over 2 years, or I have to leave it in the wastepaperbasket in 2014.

What's your opinion?

Adriaan, PE1KEL.

Adriaan,

That was my first reaction when I used my first LDG tuner, but it was the AT-1000, which is a bit louder.
You will soon notice that if you leave the same antenna on the tuner, it will tune much faster with only one click.
I use non resonant wire antennas and find an automatic tuner very convenient. At age 74, I find my memory
lacking and having a magic little box to tune to the correct match better for my radio.
The relays will last for years....have no worry about that.
Preferable to the waste paper basket.....send the little feller to me in America. I will receive it with open arms. ;c)
Keep your headset tight to your ears when tuning.
73,
Rick W3BI

It is operating normal. For the first tune on a frequency it has to
search for a solution which takes awhile. Go to another band and tune
there and you will see the same thing happen. Now go back to the first
frequency and it will tune almost instantly as it has already memorized
the solution.

Yes, it's a bit noisy. And a bit disarming at first.
But the key to long life is letting the tuner go through
it's tuning routine at a low power level like 5-10 watts
and NOT expecting it to survive doing that with 100
watts.

What are you feeding the antenna with? What type of balun are you using?

At 40m and 80m dipole is exactly a full wavelength, 1/2 wave on each element which is going to present an extremely high impedance. Use of a 4:1 balun *might* bring the impedance down low enough for the tuner to be able to tune the antenna, although your mileage may vary. I think you'll find that just about any tuner will struggle to tune an 80m dipole on 40m due to the high impedances involved.

Cheers,
Josh

In an ideal world that should work on 80m, as the antenna would be prefectly balanced, however in a practical world that's not good, and the antenna won't be balanced. Variations in height, surrounding objects, ground density, etc will result in the antenna being off-balance slightly, which will result in common mode currents coming back down the shield of your coax.

I should suggest here that you use *at least* a 1:1 balun of some sort, even an "ugly balun" style to choke off common-mode currents, however you'll have huge losses in your coax at non-resonant frequencies due to standing waves and the antenna won't perform very well on any band other than 80m (remember, just because the radio sees a 1:1 tune between the radio and the tuner does not mean that you don't have standing waves and a poor SWR between the tuner and the antenna)

Really, if you want to use an 80m dipole on any band other than 80m, you should be feeding it with balanced line of some sort, using a 1:1 *current*balun and the shortest length of coax between the balun and the tuner that
is possible. If you simply feed it with coax, or feed it with coax via a 1:1 balun at the feed point then your transmission line losses are going to be huge on any non-resonant band and you'll get degraded performance.

I have a similar setup at home, a 46m doublet antenna fed with 30m of home-made ladder line using a 1:1 balun and a 50cm jumper of RG-213 coax to the tuner and it works an absolute treat.

Norman:

The 80 Meter dipole will not be usable in your configuration for 40 Meters regardless of what balun you put on it. The impedance at the feed point on 40 Meters is going to be very high (as has been mentioned) so you simply can't feed it with RG8 and expect it to be useable. Any reasonable balun will not fix this, nor will ensuring balance of the antenna. (I believe the last post was relating only to 80 Meter operation.)

Since it's a simple dipole, the easy thing to do is to add a 40 Meter element to it. This is simply a matter of attaching another set of wires at the feed-point and hanging them below the 80 Meter element. Doing this should make it useable on a number of bands, even with the tuner at the radio and feeding the antenna with RG8. Better yet, add elements for a few more bands and you may be able to use it without any tuner.

The 1:1 balun will still be good to have in there and will help to minimize common-mode currents on the coax that might cause stray RF problems, depending on the design of the balun.

Chuck - N8DNX

Hi,

this is an easy one :

The manual states : 'Optional external Balun allows tuning of random length, long wire or ladder line fed antennas.'
Since your antenna is NOT a 'random lenght' (it's a resonant dipole for 80m) and not a long wire neither ladder line fed.

One might assume you're out of business here.

From: sentman2000
Topic: 5300 Message: 5312

Adriaan,

RTFM, if the qrg is not in memory, and a full tune necessary,
never tune at full power.
My AT-200Pro does the job at < 10W
There is a reason for this, you know.

But..... of course this is/was your standard practice.

BTW.
Cuz if you tune full smoke as a standard procedure on your
LC manual tuner, you eventually end up replacing the final transistors
of your rig.
But fortuanately nowadays these transistors are cheaper then the ones I once had to solder into my Drake.
(without the intention of starting a discussion on the quality of roll back control on earlier transitorized rigs..)

Regards,
Ger, pg5v

PS.
The pedantic wording is english.
In our first language the tekst looks much friendlier.

From: deputyjoel
Topic: 5313 Message: 5313

Hi Group,

I have a Yaesu FT857D at 100 watts. I'm running it mobile with a Z11proII tuner. My antenna is a Chameleon V2L which is similar to the Hamstick. When I tune it on 17 meters I press the tune button and it goes through its tune process and all is well. On three separate occasions while in a middle of a QSO it drops out of tune and starts the tuning process again in the middle of a conversation. Very annoying! Any thoughts on why it does not hold a tune? All grounded well, coax is good, constant power. I don't have the tuner grounded, and I've been thinking about that as a possibility.

Thanks, Joel K6OJN

I had a similar problem an it turned out the hamstick was going bad. If
the problem just started check everything for good connections.

seems to me that the LDG tuners are quite susceptible to rf.
I have a Z11Pro and a Z11ProII,the ProII I use with an FT-817 and it re-tunes occasionally;the Z11Pro I use with a FT-450 and it quite often retunes. My MFJ929 doesn't do this

Joel:

Here's the list of things that can cause this, not necessarily in order of likelihood.

* Something intermittent or not quite right with the antenna or something in it's immediate vicinity causing the load the tuner sees to change. This includes shield ("ground") connections to the vehicle body and interconnections between vehicle body parts.

* Marginal problems with certain tuner contacts, solder connections, or components.

* Instability in the radio causing enough energy to occasionally fall outside of the frequency range the tuner sees as acceptable SWR.

* The tuner chose a match that was very close to the acceptable SWR threshold. Don't know if the LDG tuners have hysteresis in the SWR sensing to prevent this.

* And, the unlikely possibility that another transmitter in the immediate vicinity is injecting enough RF into your antenna to be picked up as reflected power by the tuner.

Joel,
I have seen my LDG 200 Pro do the same thing when the SWR is real close to the threshold you have set. On voice peaks in the AM mode, it pushes just over the threshold and triggers a retune. You might try setting the threshold level higher if your xcvr can handle it or, better yet, using an antenna that is closer to resonant on the desired frequency. 73 Mike KF6KXG

Hi chuck, I would agree with all your points there. From my stance, sometimes the antenna itself is just too close to the antenna so lots of RF is getting into the chassis. Worth keeping antenna and tuner as far apart as possible. Definitely use an earth spike on the grounding lug of the radio and ATU. Also, a few windings of coax near to the antenna to act as an RF choke to stop RF working into the braid would also be advisable.

I have the Z11 Pro II and the Chameleon V2L and have suffered none of the problems mentioned. I have however had a similar problem on my AT200 Pro II when using on 160m with my Sandpiper MV10, if using considerable power as my Antenna is positioned only feet away from the radio at my home QTH, unavoidably. For top band, I just keep the power as low as I can get away with.

Do you have a choke on your feed line? Since the problem is only on 17M
you may be getting RFI from common mode currents on the feed line at
that frequency.

Mike:

I knew there was something I forgot. Stray RF can certainly cause problems with some auto-tuners. Not only that, but some auto-tuners can actually inject stray RF into the RX signal.

On the first point, stray RF, if strong enough and it gets into the tuner, can interfere with the logic in a tuner and cause it to function erratically. This is generally due to common mode currents on the transmission lines due to feed imbalance and/or close coupling to the near-field of the antenna. (We can have the discussion about earth grounds, but that starts to bring up some deep-rooted misconceptions by hams and is probably not appropriate for this forum.)

On the second point, stray RF from other sources such as computers, power lines, or whatever, can sometimes get into the receiver by way of some tuners. We first noticed this with our Z100 tuners used at the EOCs. RF noise from the adjacent data center was coupled onto the ground of the power cable to the Z100 and induced into the RF section of the tuner. We dropped several S-Units of noise by modifying those tuners. I doubt that's a problem with any of the recent LDG tuners.

Hi Daniel,

All LDG tuners try to find the best match possible. You hear the 1.5 number come up a lot because of our specs that says it will tune a match of 10:1 to 1.5 or less. That just gives you a good indication of what match range it will find for you.

Hi Steve,

The 600Pro does not have a reset. Each memory position is checked to see if it needs to be reset on the fly. So if you change antennas and retune on a particular frequency, the tuner will try the memory first. If the memory is not a match, the tuner will automatically do a complete retune from scratch. If it finds a match, it will then store the new relay setting into memory. If it does not find a match, it will not store it.

Been using an AT600pro with a Tokyo HL450B amp for a while (similar setup to what you want to do). It is a very nice combo and works very well. The AT600pro even matches the HL450 in size.....
One thing Wayne might like to answer, occasionally the tuner software seems to crash and I have to remove the DC to restore operation. The power button does not work then.
I have modified it and fitted a switch to the front panel and that solves it, and has the additional benefit of instant bypass and antenna2 selection. When you turn the power back on it just comes back to the last tuned setting... very good.

5331. IT-100 problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-03-31 23:12:45 UTC
From: wa4yiz
Topic: 5331 Message: 5331

IT-100 problem.....

works great on all bands except for 15M....
when in line...will tune to a 1.5 to 1 or less..GREAT....
BUT...attenuate's the rcv signal appx 5 S-units.....
place in bypass mode...rcv signal comes up 5-units.....

dwayne suggested trying different coax lengths...
added 5/10/20 feet...
no help...

i swapped rig's...coax switch
no joy...

removed switch...ant direct to tuner...
again no help..

the AT-100 PRO II....
works GREAT either rig...
any configuration....

SWR's..
freq tuner in swr tuner bypassed swr
3.895 1.5 3.3
7.225 1.2 2
14.285 1.2 3.5
18.134 1.5 4
21.225 1.3 4
24.965 1.6 4
28.405 1.1 4

layout....

g5rv ant at 30 feet....30 ft ladder line to 70 ft coax...
feeds a MFJ-1702C coax switch...
port A....5 ft coax to IT-100 to a IC7000..pwr is a astron RS35
port B....5 ft coax to AT-100 PRO II to a IC706...pwr is a samlex 1235
common ground point tie's ALL to a 1/2 in solid copper ground rod with 3 ft of # 10

sent the IT-100 back to LDG....
Wayne is going to take a look...

anyone had a problem simular ?

73s

5332. IT100/Icom 7200 woes

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-04-01 04:22:07 UTC
From: Jim
Topic: 5332 Message: 5332

This prob is driving me nuts! Just bought an LDG IT100 that replaces a borrowed legacy LDG AT1000. It just doesn't seem to like 75M (experiments in progress on the upper bands). Can't seem to get over 75W from the radio without RFI (from the tuner ?!?!?!?) causing the radio to shutdown and turn back on again. Had this prob previously which was cured by a ground short link between radio and AT-1000 tuner. Configuration is radio -- tuner -- Daiwa pwr/swrr meter -- feed line/antenna. It is noteworthy that my antenna (Buddipole) is resonant at less than 1:1 at 75M. If I pull the tuner out of circuit the radio is happy with the Z it sees to the antenna.

In addition to the short (6 inch) jumper cables between radio/tuner/swr meter, I've tried numerous solutions including running a ground to the water pipe just outside my apartment door (I'm at ground level). Repositioning the tuner has had no effect. Next will be extending the control cable and coax jumper to move it further away from the radio. It is noteworthy that I have no radio shut down with the tuner completely out of circuit.

Any ideas anyone?

-- Jim

Have you tried talking to Dwight from LDG he is on this forum he can likely steer you to the tech guys in his organization,

What form of DC power are you using? Battery or Power Supply and if so what specific model, all power supplies are not necessarily the same if there switch mode. See QST from Feb 2012 for examples the EMI on the dc power leads might be the culperit.

Hi Doug --

Using 12 deep discharge batt as my power source. The damned prob manifests ONLY when the LDG is connected in circuit. Remove it and all is right in Camelot. I've got my Buddipole vert tuned by way of using an iP230 SR meter/analyzer to tweak it (ref: http://www.iportableus.com/).

Between tuner & radio tried ferrites on the short ground lead, control cable, RF jumper (18 inches of RG-58), battery leads. Will try the mic.
I just verified that the prob exists on 40M as well. I've got a borrowed MFJ artificial ground I'm going to try. Else, next stop will be LDG tech support. Frustrating!!!

Jim

Have you tried the artificial 1/4 wave ground leads method instead of the water pipe direct to radio ground stud,not familiar with the MFJ artificial ground product.

have you tried the single point ground method instead of the daisy chain method.This means an individual lead from each piece direct to the single radio ground and one connection to earth (or the artificial ground) (use 2 leads for each band).

We found in today's electronic world proper ground path method was more critical than say 10-or 15 years ago

This creates a good rf ground, the water pipe coming into the building might be plastic after the utility shutoff and the old idea to copper pipe ground no longer works, my city mains are all plastic the only copper is about 20 feet to the city shutoff valve near the street

We found in telecommunication where we use to rely on the water pipe exclusively (30 years ago) we had to drive our own driven ground rod network to replace the water pipe primary ground point

One puzzler about my tuner problem is that when I remove the tuner and go direct between the radio and the antenna (regardless whether my Daiwa meter is in line or not), the problem does not occur. So, tuner problem, like maybe it is radiating?

The other problem might be ground loop between gear usually caused by daisy chain ground method.

The rf has no place to go that's why the single point ground system.(refer to page 7 note in the LDG manual it makes no mention of daisy chain grounding.

My LDG works flawlessly on a single ground point

Ask about the susceptibility of control wiring between tuner and radio

Every ham shack is different

I tried all the great suggestions including from LDG: I removed the SWR/Pwr meter from the transmission line entirely, added several ferrites to the tuner control cable and rechecked/retweaked my Buddipole. Configuration now consists of radio-tuner-feedline-TRSB balun-antenna. Cured my problem for SSB anyway. Can now transmit at 100W without the prob manifesting. Howumsoever, in RTTY or AM modes (I've not attempted CW as I have no key and CW will not key up via the PTT), pro is still there unless I back off 20-30W. Going to retry adding in the water pipe ground just to see what it does ...
Argh!!!!

Hi,

Pretty sure if the IT-100 is like the AT-100 then the power rating is in PEP, which means in PSK you're limited to about 30W as PSK is a 100% duty cycle where as PEP is around 30%. At 100W PSK my AT-100 get's VERY grumpy, inductors start getting hot, and the SWR goes through the roof. Something to consider perhaps!

Cheers,
Josh

What power are you trying for RTTY and AM? Most modern Transceivers will not work constant power Modes, such as RTTY and AM, without problems.
What you are seeing with RTTY and AM may be normal.

Well, therein might be my problem and I'll have to go back to the manual. I have been under the impression that the radio automatically scaled back power on each of those modes if the power was set to max, i.e., 100 W. If it doesn't, well, I need to manually control power out accordingly.

Thanks for that tip.

Jim:

Did you say you're using a BuddyPole? If so, in which configuration.

If the problem is stray RF, it's because it's getting to the equipment on the transmission line, possibly due to feed imbalance. Choke it off at the antenna by coiling the cable or using a "common mode" choke. Could also be coupling into other cables in the near field. Apply chokes there also.

Keep you're RF at the antenna.

Chuck - N8DNX

5344. Re: Z11proII tuner problems

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: cfmilazzo
Topic: 5313 Message: 5344

Here's are interesting reports of RF pickup by my Z11proII tuner:
I work in a medical office building and we often have a mobile MRI trailer in the parking lot. The MRI was operating and making its repetitive clanking sound one evening while I walked to my car parked about 20 feet away from it. When I got into the car and turned on my Alinco HF radio and LDG tuner I was surprised to see and hear the tuner clicking and flashing in unison with the MRI (a zombie tuner!). Apparently my Comet vertical antenna picked up enough RF from the MRI trailer to activate the SWR sensing circuit in the tuner.
Also, my home station has two HF antennas. An 80 through 10 meters screwdriver vertical antenna is about 15 feet away from a 40 meter full wave loop to which the Z11ProII is always attached. The Z11 works like a charm when using the loop antenna from 5 MHz through 50 MHz. However, when I transmit through the screwdriver vertical, the Z11 which is attached to the loop is unpredictable...sometimes the lights flash and the relays chatter. Putting the tuner into the bypass mode does not stop this behavior. As it has no power switch, the only solution I've found is to disconnect the antenna or the DC power cord from the Z11 tuner.

Z11proII tuner. My antenna is a Chameleon V2L which is similar to the
Hamstick. When I tune it on 17 meters I press the tune button and it
goes through its tune process and all is well. On three separate
occasions while in a middle of a QSO it drops out of tune and starts the
tuning process again in the middle of a conversation. Very annoying!
Any thoughts on why it does not hold a tune? All grounded well, coax is
good, constant power. I don't have the tuner grounded, and I've been
thinking about that as a possibility.

Hi Paul,

I just joined the group and was wondering myself about being able to use the Z-817 to match an end-fed halfwave on 40 and 80. So I saw your unanswered question.

Mate, for 80m you are going to need a much longer antenna OR a fair bit of added inductance. Just make a coil yourself out of copper wire and try a few values until it works.

Adding a 4:1 balun will just make the impedance a but easier to match. It won't help the thing get closer to resonance on 80m.

Anyhow, that is my 2 cents worth, (less inflation and plus sales tax).

>
> Due to deed restrictions, I'm stuck with a short end-fed "stealth" antenna about 15' long. With the Z-817, I can easily tune 40 meters up, but with the Z-817, cannot get a match on 80 meters. With my MFJ-902 "Travel Tuner," which is a "T" design, and clearly has more range, I can tune the antenna on 80 meters.

From: mcyman
Topic: 5346 Message: 5346

Hello all , first post here.
I just received a z100 plus, and live in antenna restricted area.
I would like to use a long wire , probably can manage about 30 ft or so into an old oak tree nearby.

I was wondering if any one has had a similar antenna, and how it worked?
I think i can mange about 30 ft in height like a sloper.

I be-leave a 4:1 balun will be necessary but not sure.

If so I will be looking for one.
thanks rob n8rt

I ran a 66 ft long wire with decent results. Coax feed to LDG 4:1 balun. Since I was on 2nd floor,with balun attached to window trim, a direct ground was not practical. Instead, I attached a 1/4 wave counter poise for each band I wanted to work. I had an initial problem with RF getting back to the tuner. This was solved by making a multi turn choke with the coax, close to the tuner. Get the wire as high and far away from the counter poises as possible.

Hello, Matt.

Today I received a parcel from LDG with the free balun.
I didn't expect such a quick reply from LDG.
My free Balun rebate form was sent 3 weeks ago.
Now I have a new playing tool to spend my time :-)

So, the address of LDG in the USA which Joe mentioned is correct.

By the way, I want to thank LDG for the free balun I received.
Thanks.

Adriaan, PE1KEL.

If it is anything like the TS@K you can use the AT300 connector. A
description of the pins is included in this manual.

The Chameleon Hybrid plus that 30 foot wire works beautifully on 80-6 meters. It does require a tuner and is rated to 1,500 watts.

http://www.chameleonantenna.com/ChameleonHybridSerie/ChameleonHybridSerie.html

I wish I had stock in Chameleon. Just use there products and am very happy with them.

Hello All,
Many thanks for all that posted information re an LDG Z100+ and a 30ft long wire.

After thinking about the 4:1 Balun, I realized that I will need a weatherproof unit, as I will use Coax out of the LDG tuner than the balun which will be located outside.
So dont think the LDG RBA 4:1 fit the my application, otherwise I would have to weatherproof the balun.

I did find a few outside 4:1 baluns on EBAY that I may bid on, but a local ham friend offered a 6:1 Balun, that I ma try first.

Anyone using a 6:1 balun and LDG tuner with a long wire?
thanks rob n8rt

PS That Chameleon, looks good , but is expensive! %250.00 bucks.

You should try winding your own 1:1 current balun, it's much cheaper and amazingly simple!
Here are pictures of homebrew baluns "currently" used (no pun intended) with my Z-11ProII tuner http://www.qsl.net/kp4md/zipcord.htm#balun
The references give a review of balun theory and applications.

The LDG baluns are not waterproof, but they seal up pretty tight. If you mount it inside a plastic food container with a snap on lid to keep the rain off, it will work well outdoors. I had one outside for an 18 month stretch and the only noted changes were some rust on the screws and bolts. Inside was nice and clean and dry.

5361. How To Build "To Go Box" w/Yaesu FT-857D using LDG YT-100(Love it)

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-04-21 19:42:29 UTC
From: n4ktz
Topic: 5361 Message: 5361

I had requests to show the front of my GO BOX (had back view but really not a good front view) and go over mounting procedure, equipment list and a few other important items.

If you want to watch entire completed video of "To Go Box", here is the link with entire video edited together!

http://www.youtube.com/watch?v=yPh2aGViiKY

if you already saw part 1, here is ONLY the additional information on how equipment was mounted, what kind of shelf works best, etc in part 2

http://www.youtube.com/watch?v=g0x-A929Kwk

Enjoy!

5362. Any Antenna Ideas for LDG Balun?

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-04-26 22:48:47 UTC
From: n4ktz
Topic: 5362 Message: 5362

I just received the 1:1 LDG Balun. I would like some antenna ideas. I think a longwire will be the easiest to do however I could do a dipole. If anyone has experience with LDG baluns and has made antennas with them I would like to know what results you had.
Thank you,
73

Hi Steven,

I'm running a 46M doublet (151') fed with 30M of home brew open wire (although not really open, it's made from insulated wire) then into the LDG 1:1 balun and a 50cm RG-8 jumper to my AT-100 Pro 2.

It works quite well on all bands from 80 to 10 (including 30, 17 & 12) although it can get a little testy up the top end of 40m, it will tune and works quite well, even on bands where it's waaay too long (10m)

Cheers,
Josh

5364. Just got my YT-100, strange problem, reception better w/only center prong connec

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-04-27 00:27:03 UTC
From: n4ktz
Topic: 5364 Message: 5364

I have an 857, using a LDG YT-100 tuner and an end fed antenna. I am having a strange situation. Upon hooking up my end
fed antenna, I pick up stations but it seemed somewhat toned down not receiving good..stations and normal band static. I was messing around with the connectors and when I unscrewed my connector(PL 259) leaving only the center prong connected, it received much better. I cannot figure out why this is. Is this a problem with the tuner? Does anyone have an idea of why. Could it be a grounding problem? My SWR is very low. Upon asking the manufacture of the antenna, he said it was normal for the antenna to show a short when antenna side and ground side checked with VOM.
Any help would be appreciated.

Hi,

We need a little more info.

What is the antenna you're using?
Is it a single band or multi band?
Do you know what type of matching network it's using?
What band are you seeing these results in?

Cheers,
Josh

I am using a multi band end fed. I am not sure of the matching system I just know it has a wire side and ground/counterpoise side. Upon VOM it is normal according to the manufacture to show a short. In fact they said if this antenna did not show a short(that is what I call it even though it it not really a short)there would be a problem. maybe that will help you determine what type of system it is. It does it on all bands and the tuner does tune the swr down on them all very low! I just cant hear anything much when antenna is connected all the way.
I appreciate your help and input.
Steven

P.S. sometimes it does take a while for the tuner to tune down the SWR though, especially when going from band to band.

Hi Steven,

As I said before:

What is the antenna you're using? (Brand, make, model) Can you provide a
link to it online so we can look at it?
What band are you seeing these results in?

What you are most likely seeing as a "Short" is actually a grounded
inductor as part of the antenna's matching network (Or part of an internal
balun in the antenna) but without knowing WHAT the antenna actually is it's
hard to offer help.

It's like saying "I've got a 4 door car and it's not starting" and the
mechanic says "Ok, so what kind of car is it" and the response is, "Well
it's a blue one and the manufacturer says it should work" ;)

Once we get some more info we should be able to help. How far is the
antenna located from your rig/tuner?

Cheers,
Josh

Steven--
You really have not given enough to allow help. What make is the antenna? How long is the "Long Wire"? How is it coupled to the tuner? Have you measured any of the characteristics of the antenna? How far is it to "ground"?
Bill--W4BSG

Hello all,

I have just unpacked my old AT11-MP that has been kept in the attic after the birth of our son some 10 years ago, now I have started to get the hobby back up and running. I see that there has been an upgrade to the chip to allow memories of LC settings, I have e-mailed LDG and W4RT to try and obtain the upgrade kit, but have been told it's no longer manufactured, but was told it's possible that some retailers might have old stock, is anyone aware of who might still hold stock.

73's to all

Did you set your radio up for 10 watts cw mode and key down till tuner finishes what radio are you using? did you read the LDG manual.
Also the lowest swr it goes to is 1.5:1

New photo here, try it if you have a restricted QTH

http://groups.yahoo.com/group/LDG-auto-tuners/photos/album/1805224518/pic/list

I am using a 857D, mostly running 100W but sometimes run with 10 Watts output.
My QTH is Port St Lucie ,FL With HOA Antenna restrictions.

My antenna wire is about 25 ft long

Just worked ZL2BX ,last night (4-28-2012 12:26 AM EDST) on 20 meters, 57/8
signal report.

CT1FFZ Portugal 59+ received 20 meters

Worked both Coasts of the USA 17 Meters

And many local stations on 40, I have not tried 80 meters yet, but I am sure I
will need to make the antenna wire much longer!

I am using a Brand New Alinco DX-SR8T...

I put it in CWL @ 7.2000and low power which is 10 watts and same thing..Red Tune Lights Blinks 5 times after i push the Tune Button, hold it till the Tune light goes out..as far as I read in the directions, then it Blinked the tune Light 5 times..which supposedly means NO RF Detected..

I did try AM mode at same freq and got a Steady SWR Light..and it tuned and wirred like it should making the adjustments whirring noises and wala Steady Green light.

On most rigs you need to use a key in CW to key the rig. I don't know that rig you have but you can use AM and maybe RTTY. What you got in AM is what you should get.

Ok so maybe it, The Alinco DXSR8T is my Rig needed to be in AM mode, there is no mention what mode to use the Z-100 Plus in, not in the manual..

It must be working as it went Full SWR light on my LDG Z-100plus as
according to their tech support you use either CW or AM mode, so I guess it
is working..you need to use a continuous carrier wave like AM or CW now
this was with the last resonate setting I had on it, same cable cept it has
a combiner in it, we had split the cable in 2.

Can I get away with getting a SWR Meter and making it a little it resonant
? last time i had a fancy analyzer which i no longer have now.

The new radio does not have a built in SWR meter..

You could place an SWR meter between the tuner and the radio yes.

From: slaternorthp
Topic: 5382 Message: 5382

have just purchased a AT 1000 pro II and attempting to connect to a Kenwood TS2000 and Ameritron AL-811.

Currently do not have AL-811 connected or inline at this time until I get the bugs worked out of the Kenwood connection.

When set in the auto mode on the AT 1000 it will not tune my G5RV, no tuning cycle takes place. have attempted a manual tune as well with no success on the tune cycle operating.

am using 5 watts to attempt to tune/activate the tuner in the auto mode for tuner.

Do have a IT100 for my Icom 706 MKG II which works prefect on the G5RV.

anyone else have this tuner connected to a Kenwood?

You need to autotune in AM Mode at like try 7.2 mhz

I would bump it up to 10 watts and try again. Also double check the obvious ---- check the ant connections so you are chosing the right ant port and make sure the coax is hooked correctly. Tune in AM or CW modes, not SSB. If still having problems, call LDG, they are customer-friendly. 73 Mike KF6KXG

5387. Z100 interface to Yaesu FT-450

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-05-03 09:31:29 UTC
From: haydude1111
Topic: 5387 Message: 5387

I have an LDG Z100 Tuner that I would like to interface with my FT-450.

I found the following schema on the ham forums, but no confirmation that it would work.

Here's the pinouts for the Tuner jack on the FT-450D and the Icom Tuner Connector:

FT-450D Tuner Jack Icom Tuner Connector

Pin 1 +13.8 V Out Pin 1 (Key)
Pin 2 TX Gnd Out Pin 2 (Start)
Pin 3 Gnd Pin 3 (+13.8V)
Pin 4 RXD Pin 4 (Ground)
Pin 5 TXD
Pin 6 Tuner Sense
Pin 7 Reset Out
Pin 8 TX INH In

Looking at the pinout for the LDG Icom interface, it appears the pinout connections would be as follows

FT-450D Tuner Jack Molex (Icom) Interface

Pin 1 +13.8V Pin 3 (+13.8V)
Pin 2 Tx Gnd Out n/c
Pin 3 Gnd Pin 4 (Ground)
Pin 4 RXD Pin 2 (Start)
Pin 5 TXD Pin 1 (Key)
Pin 6 Tuner Sense Pin 4 (Ground)
Pin 7 Reset Out n/c
Pin 8 TX Inh In n/c

Please could anyone help?
Thank you in advance.

From: Leonard K. Pennock
Topic: 5387 Message: 5388

Don't think it will work. From what I understand pin 4/5 are an actual
serial data bus and won't do what you are trying. You are better off
using the linear jack and use the TX REQ In line to have the Z100 start
a tune cycle.

Topic: 5387 Message: 5389

Heydude,

I think it can be done, just not on that port. If you look at the LDG IC-2000 interface cable, it connects the tip from the tuner to the TX REQ through a 680 ohm resistor. This works on the FT-2000 radio that has an RCA jack for TX REQ.

If you look at the linear port on the 450 and 950, it has the same TX REQ on pin 10 and should work the same way. However, it looks like Yaesu has a typo in some 450D manuals that show pin 10 as "TX REG".

We have not tested it, but it's on our list of things to do next week.

Hello,

We have one of those radios, but have not put it on the list yet. We're about 99% sure it's a code change.

Right now, we recompensed using one of our generic tuners for the SR8T.

5392. Tuning a G5RV-JR with AT-200Pro

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-05-06 02:53:42 UTC
From: carl.krauthauser
Topic: 5392 Message: 5392

I've recently setup a W8AMZ G5RV-JR up about 20ft. The ladder line is attached to a homemade air coil balun (approximately 12 turns, 6" inner diameter) which is then attached to about 20 feet of RG-8 coax that then attaches to my AT-200Pro, which in turn is attached to my Yaesu FT-1000MP Mark V Field.

Un-tuned on 40-10 meters, I get a fair amout of background noise, ranging from S7 to S2, depending on the band (I live in a VERY noisy area). When I tune this setup with the AT-200Pro, the noise level drops down to S0, as do all signals. I find that to be rather peculiar, as when I had the same setup with a regular G5RV instead of the G5RV-JR, it would generally be the reverse situation. The regular G5RV is no longer up, as the trees I used for stringing it are no longer in existence.

It's almost like the autotuner is tuning to the level of a dummy load, for there is about the same level of reception as my dummy load. Might there be a problem with the autotuner? Or might there be something more elementary?

Thank you in advance for any and all insights!

What I do not get is that the EXD-2 will work with Alinco Radios...even the DX-SR8T even if it did have a code change, so how could that be..if your interface cable works on the other Alinco Radios.. lets say they made a code change, how come the EDX-2 still works then? makes no sense actually to me..

From: Jim Lynch
Topic: 5382 Message: 5395

I recently acquired this tuner. I read in the manual that when you power down the tuner (with the power button) it is supposed to go into bypass mode. It appears that this tuner is disconnecting the antenna in power down mode. If I have it on and place it in bypass mode, then the rig works great on a resonant antenna but if I power it off, the receiver goes dead and the swr goes wacky.

Is there something I need to do to fix this? It has worked this way from the first day I turned it on.

Thanks,
Jim.

Hello all,
Purchased a used YT 100 at a hamfest to use on my FT857D. I have connected the tuner and radio together and made menu changes, 4800 baud rate, CAT selected, as shown on the YouTube instructional video. I push the tune button on the tuner and nothing happens, no light, no noise, nothing. I have tried 2 different coax jumpers, checked each terminal of the mini-din cable with an ohm meter .Anything to check before I write this off as another reason to not buy used gear at a hamfest?

Thanks

Check and make sure that the menu is set correctly for the tuner. It’s menu 20 I believe that it should be set to CAT. and menu 19 to 4800. double check this you must hold the function key for over a second to set any changes.

Hi Jim,

We had to pick one antenna port or the other to be the default. The relays used are non-latching, so when the DC power is off, it's designed for the signal to go straight through.

As the other person said, if you move your default antenna to the other antenna port, it will work fine with when the DC is off.

Hi:

Strange thing happened today, the tuner decided it could not find a match and flashed all the leds. I tried again and still will not find a match. This is working into a dummy load that is confirmed being good. I opened the case and nothing smells burnt and upon inspection with the old magnifying glass I se no burnt components. Reinserted the tuner inline and still the same problem. Just can't find a match with either a resonant antenna or dummy load. Couple things come to mind, either a problem with the unit has locked up somehow or a firmware fault. Is there a way to completely reset the unit.

I am looking for some details (from LDG?) on some of the logic available from the front panel for my remote base.

Essentially, I want to turn Auto on/off, tap into the Logic high for the Auto LED and possibly the antenna switch and that LED as well.

Is there someone from LDG on this forum (since they don't share schematics) that can help me out. Is there enough logic on the ribbon cable from the tuner to the front control panel?

Once I have all that, I can use my LP-Remote to control all the functions I might want to use.

I did search the forum, but I didn't turn up anything useful.

Feel free to email me personally.

Mike
Just to be careful, check the dc continuity of all the connecting coax before digging into the tuner. Also make sure the correct antenna is chosen on the xcvr. I once had a similar issue that turned out to be a coax fault. 73 Mike KF6KXG

Hi Mike:

Definately not the coax or wrong antenna as when the two coaxes are connected together I get perfect match on the beam. I also did check for continuity and all is fine with the coax etc. Thanks.

I am not sure if I changed a setting or not but lately I have been on 20M and the band seems almost dead, hardly any sign of signals in the digital portions I monitor. Then, if I issue a TX command and the LDG AT200 Pro briefly tunes, theTS-2000 and band is suddenly alive with loud signals when the AT200 switches back to RX.

If I have my tuner, say, set for 40-meters, I have to press the tune button to "touch it up" if I go to 20 meters as well. I think it's the nature of the beast.

Subject: [LDG-auto-tuners] Almost dead until tuned ?

I am not sure if I changed a setting or not but lately I have been on 20M and the band seems almost dead, hardly any sign of signals in the digital portions I monitor. Then, if I issue a TX command and the LDG AT200 Pro briefly tunes, theTS-2000 and band is suddenly alive with loud signals when the AT200 switches back to RX.

yeah, you have to tx to tell the tuner to tune the band up.

Hi,

First post to the group!
I'm considering buying an LDG AT-600Pro autotuner to use with my Kenwood TS-850 and Ranger 811H amp. Anyone have any experience with the AT-600 in use with a TS-850? If so I'd like to hear your comments particularly if you experienced any issues. Do you need any kind of interface between rig and tuner or is it simply "plug 'n' play"??
Any comments welcome!

Cheers,
Andrew EI8KF

Andy,
This is normal as others have told you because the tuner tunes the antenna for both the transmitter and the receiver. With a better match, the receiver picks up more signals. While external tuners do this, I have read somewhere that the internal tuners on some rigs do not. They only tune for the transmitter. Another reason to use an external tuner. 73 Mike KF6KXG

There are no differences between the Z-11 and the Pro2 that a user would notice. LDG replaced my Z-11 (just out of warranty by the way) with a Pro2 and I saw no difference at all. The spec suggests that there are fewer memory slots but since there were several thousand to start with, who would notice!
Enjoy the Pro2, I certainly do!

I purchased an at-897 tuner along with the radio and hoping the group can help me:

1. Anyone know if its possible to have the tuner boot up in bypass mode? It appears to power up on what frequency was used last.

2. It only stores in memory perfect matches. Any way to get it to store the less than perfect matches?

In actuality the tuner does not "boot up"

The 897 tuner uses latching relays. Once a tune point is reached by pushing the button to unit turns off. By extension, if the tuner is in bypass, it stays in bypass.

In effect, it maintains its state regardless of whether the radio is on of off.

Thank you David.
I forgot about it using latching relays.
I have an old ICOM marine tuner that came with an original M700. The radio got salt water in it but the tuner was perfect. It's also a switched 'L' network with one memory location. A set of DIP switches. The tuner reads the switches when powered up. I have it configured to have all relays off. All I have to do to force a bypass is cycle power to it. It always shows a proper load to the radio because of a resistor devider network used for matching. It's designed to be strapped to a mast and not very portable.

I guess the 897 tuner will always power up in bypass if the last thing I did was hit the bypass before powering down.

Dave....

The 857/897 cable will not work with the 450. The 450 has a 10pin din
jack that contains the fuctions provided on the ACC jack of the 857/897.
The 450 does not have the same 3.5mm stereo jack the ACC on the
857/897 uses.

Hi John,

Probably teaching grandma to suck egg here, but of course the Z-11 is a fully auto tuner so you can just transmit a carrier by whatever means and it will tune anyway - regardless of an interface cable.

I have that tuner and can use with any radio with or without the cable (that just does the carrier bit on a button). When using the fully auto mode, its worth using a lower power carrier, AM mode is perfect for this. All modern Yaesu radios have an SWR roll-back but if you can tune at 5w instead of 100w, that's better.

LDG 600 Pro info ,
Hi all, just purchased a 600 pro auto tuner, and was having an issue with the 600 OFF position.

I had my antenna connected to the ANT 1 port, and when the tuner power was OFF, the tuner did not By pass to Ant 1?

I than connected my Antenna to Ant Port 2 and it worked.
My Transceiver was than connected to the antenna with the LDG600pro OFF!

I was wondering if this is normal? I did not find any info in the Owners manual.

Lastly I could not get the Bypass LED to work , and finally found the info on top of Page 16, when the tuner power is on, Pressing the TUNE button momentarily places the tuner in BYPASS. Maybe this info will help others.

thanks rob n8rt

Topic: 5434 Message: 5434

Hi All, I have a Pro 100 II that I use with all my Icom radios. I have all three of the different 706s. Im using it right now on one if the original version of the 706. I have two of these and have tried it on both and both do the same thing. With the control cable hooked up the tune button on the front of the radio will not put the tuner in tune mode. I tried it with my mkII and MKIIG and it works with the button on the radio no problem. I also have the LDG AT11MP tuner and it works with the Tuner button on the radio on the original no problem. I must be missing something. Anyone have any ideas? Thanks Ricky KD4RFV.

5435. Tuner for IC-746 remote station

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-06-17 14:09:35 UTC
From: Joe
Topic: 5434 Message: 5435

Hello to All,

I'm looking for an auto-tuner solution for an internet accessed remote ham station for my club. The radio will be an Icom IC-746 connected to a multiband 80-10 vertical. I will be using Ham Radio Deluxe and Skype for remote control.

I would like to leave the tuner active at all times so wherever a user transmits it will automatically tune for minimum VSWR. The LDG tuners have memory available, but I do not know what frequency the users will be on in order to pretune it and memorize the settings.

Any ideas?

73, Joe, K1ike

Topic: 5434 Message: 5436

Hi Joe,

You would be best served by rolling your own software to intercept the remote user frequency entry and using an LDG AT-200PC until such time a replacement comes along with enough remote control support to handle such applications.

However, that being said, an AT-200PRO and later that you pre-tune in 50khz steps up front across all bands would be a fair approach.

The one issue that you are going to have is the last tune frequency when not in bypass if previously tuned within the low bands. Due to the tuners Hi-Q when tuned and not in bypass the lower in frequency, this presents an issue on RX within the low bands and above However if tuned on say 10 meters, the attenuation on RX will be minimal. Providing for RX BYPASS can be achieved by custom interfacing and software, the PRO series will exit BYPASS upon application of RF automatically.

Here my main station is remote just 100 feet up the hill from the house via a wireless bridge, the software that I author supports the AT-200PC with macro and on the fly use of any command (all LDG PRO series tuners as well as all transceiver internal ATU's via CAT are also supported) thus in both automated ALE operation when in manual control for various uses, I have full command and control of all station aspects that can be remote controlled and also I have visual awareness using USB port CCD camera's, which I highly recommend having in place for all remote controlled stations.

/s/ Steve, N2CKH

I agree, Grant. Over the last 2 days I installed (with help because I'm in
a wheelchair) a ALS-600 Ameritron No-Tune Solid State Amp on an IC-7410
HF/50MHz rig and through an LDG AT1000 Pro II with the external M1000 Meter.
No trouble at all.

5439. LDG AT-200Pro II problem icom IC-7600

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-06-24 16:09:47 UTC
From: yv5of
Topic: 5439 Message: 5439

Hi groups,

week installing my new IC-7600 with my AT-200pro II (attach ICOM cable interfaces) but I have the problem that when I perform the tuning of the antenna (G5RV Jr), the tunner indicate error lost tunner RF. Test other automatic tunner same error.

My Yaesu FT- 950 working fine (No cable interfaces) with AT-200 Pro II and G5RV Jr antena.

What could be happening? Someone had this problem?

Thx - 73!

Severino - YV5OF.

5440. Quirky AT-897

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-06-24 20:10:11 UTC
From: n2csa
Topic: 5440 Message: 5440

My amateur radio club used my FT-897D and AT-897 with a full sized G5RV for field day. My AT-897 has a quirk. It will not tune the G5RV on 80 meters between 3.850 and 3.999. It tunes 80 meters below 3.850 and all the other bands just fine. On the affected frequencies the AT-897 relays do their clicking and eventually stop but the FT-897D continues to transmit. I have to power the FT-897D off and back on to get it back into receive mode. We tried varying the length of coax from G5RV to tuner to no avail.

Any ideas?

5441. Z-11Pro won't stay bypassed.

Yahoo group: LDG-auto-tuners (2010 — 2017)

From: Jim Lynch
Topic: 5441 Message: 5441

At field day we had multiple antennas we swapped from transmitter to transmitter. One of these was a 220' longwire with an SGC-230 antenna coupler. It worked great but when we connected it to one of the radios with a Z-11Pro tuner in bypass mode and tuned the radio to a frequency that the SGC had to tune, the Z-11 came out of bypass mode and started to try to tune the antenna at the same time the SGC was. I'm of the opinion that the Z-11 shouldn't do anything when it's in bypass mode. By bypass mode I mean pressing the tune momentarily and observing the lights flash 3 times.

Other than causing the 706 to key momentarily, it didn't cause any harm. The SGC did its thing and the Z-11 was happy, it was just very irritating to have the excess tuning and have the transmitter key up automatically.

You didn't put the tuner in semi mode by just doing the quick press of the tune button. To keep it in bypass mode you also need to put it in semi mode where a press longer press of the tune button is required to do a tune cycle.

Why would you run a KW on AM its such a waste of bandwidth . How many hams are on AM these days and is 6khz wide mode reduces number of users in comparison to ssb operation.

The use of fm and ssb makes better use of the spectrum

AM tends to splatter so bad if the amp is not properly set up and correct filtering exists. AM is an dinosaur mode from the 1960 ERA before the technical refinement(s) existed for ssb operation.

One would sincerely hope this is not a widespread practice in the hobby and hopefully the operators do know how to properly set up the older equipment.

Many new hams are strictly appliance operators according to today's license structures in most countries.

We have heard some poorly operated equipment consuming 25khz bandwidth and wiping out a large part of the spectrum in North America lately by some hams being very poor operators.

Hi Jim

AM TRANSMISSION usually has 50% Carrier and 25%USB(UPPER SIDE BAND), 25%LSB(LOWER SIDE BAND),power split

SSB PUTS 100% POWER INTO EITHER LSB OR USB DEPENDING ON THE BAND WORKED MAKING BETTER USE OF BAND WIDTH AM WAS 6KHZ WIDE 3kc either side of the carrier.

LSB (7.0 AND BELOW) ABOVE 7.3 MHZ USB .BASED ON NORTH AMERICAN BAND PLAN FREQUENCY ALLOCATIONS

TODAYS SOLID STATE RIGS SELECT THE CORRECT SSB AUTOMATICALLY,older tube rigs you had to select manually

Subject: [LDG-auto-tuners] Re: IT100/Icon 7200 woes follow-up

Well, therein might be my problem and I'll have to go back to the manual. I have been under the impression that the radio automatically scaled back power on each of those modes if the power was set to max, i.e., 100 W. If it doesn't, well, I need to manually control power out accordingly.

Thanks for that tip.

This sounds familiar.

Had a similar situation, but my 897d would just lock up and required a power cycle to get it running. I can tell you what I did to fix it. Problem is with the radio, not the tuner. I ended up using a six foot length of coax between them and rolling it up in a tight loop. This acts as a balun and keeps rf from feeding back on the shield.

N2CSA,
Do you use a balun or air choke with the G5RV? If not try it. It's a great ant but some of the ones now sold (like MFJ) do not come with a balun as the ant was originally designed to use. We used one at field day, but I wound an air choke and we had no problems. Basically just wind the coax where it connects to the ant into a coil about 6 or 8 turns, 6" diameter and zip tie them together. 73 Mike KF6KXG

5447. HELP with M1000 meter.

From: Pete
Topic: 5447 Message: 5447

I purchased an AT-1000 Pro II and M1000 Meter from R&L Electronics in Ohio last week. To go with an Icom IC-7410 and Ameritron ALS-600 Solid State Amplifier. The meter was first taken out of the box yesterday. The tuner appears to function correctly, but the Meter appears to have a problem. When the needle is deflected and returns to 0, it goes beyond 0 and hits the "pin" where it sticks until the meter is gently slapped on top. This happens at 100 Watts or 600 Watts.

Any ideas?

Personally I wouldn't worry about connecting the tuner to the 735. Just put a AT 200 Pro II tuner in line, set it to auto tune. Tune to the frequency you want to operate, switch to AM and press the mike button. It'll tune and that's that. Next time you are near that frequency the tuner will consult its memory and tune extremely quickly. Once you've used it for a while, you'll find it never needs tuning unless you change antennas. I have been known to turn my IC-730 down to 5 watts to avoid interference. Plug in a key, start at one end of the band and find a clear frequency, send your call and then hold the key down until it tunes, slide up (or down) 30 khz more or less and repeat. Do this for all the bands you operate on and from then on, the memory takes over and you don't have to do anything until you change antennas.

Jim.

Just make that simple phone call to LDG tech support folks so your not guessing.

I can't see them(LDG) listing every conceivable radio made(remember it might be 30 years back or longer) from all the manufacturers that have existed as maintaining a long list is very time consuming.

Making that phone call is a lot cheaper than blowing up your rig or new tuner

Use common sense and keep it clean and simple.

5455. Question about LDG Baluns

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-06-26 22:41:39 UTC
From: n8xxham
Topic: 5455 Message: 5455

Is the a place to ask a question about a defunct LDG Balun?

I have a LDG 4/1 balun which got "fried" during Field Day (We were running 100 watts to "probably" a very high impedance - but which a LDG autotuner would match. When I switched to 40 metres, it tuned up nicely at 10 watts, but went bonkers at 100 watts, with highly erratic SWR.

A minute or so later I noted that there was a dent in the case, and it was quite hot to the touch. Another op had a KW balun, which we put in place.

After opening the case, it looked like some (much?) of the enamel was off the magnet wire, and the smell was very similar to "fried magnet wire."

Does anyone know the proper specs for the core? I've the question to LDG Tech Service, but figure someone here might know.

BTW I have a replacement on order from Universal Radio. Should be here by this weekend. But I might as well rebuild the olde one for a spare

Thanks for the bandwidth.

I have an LDG 4:1 balun that is very similar to yours (fried) and a second one got very hot, both were running about 80 watts on RTTY. According to some knowledgeable sources these baluns are only good for about 50 watts although they say they are rated at 200 watts by the manufacturer. I solved my problem by replacing it with a 5KW balun.

Topic: 5455 Message: 5457

Hi Rex,

You are correct, in RTTY mode, LDG baluns would have a rating of about 50 watts. We rate them at 200 watts PEP.

However, I did notice that we did not have the "PEP" listed on our web site, so we've added that to the specs.

Thanks for the feedback,

Dwayne Kincaid

From: Cortland Richmond
Topic: 5455 Message: 5458

Dwayne,

We were using a friends 4:1 LDG Balun at the W8M CW position for Field Day and suffered first intermittent, then permanent, mismatch with the Z-11Pro. The Balun case was starting to melt with 100 Watts of RF and repeated CQ's . He's already contacted you and I suspect he'll rewind it with a larger core.

I substituted a Palomar HB6 and normal tuner operation was restored .

However, it appears that these (as you say) 50W continuous-rating Baluns are may not be well suited for use after LDG's otherwise excellent tuners, which when matching a high SWR load can subject a following Balun to more stress than a matched load on its balanced terminals would, as that has the effect of reducing the RF they can safely handle. Sevick has something to say about tuner Baluns and it appears he is right. FWIW, even a 1:1 LDG Balun warmed up perceptibly there, which is when I got out the big guy.

By the way, I'm not knocking LDG Baluns in particular. I've seen someone else's 2.4 inch diameter 1:1 get hot at 100 W with a inappropriate load.

As Robby says: Danger Will Robinson!

From: Mike
Topic: 5459 Message: 5459

Are ICOM and coax jumper cables supposed to be supplied with the Z11?
The Rev B manual says "supplied".
Didn't get any in the one I got from GigaParts today.

It tunes 80 meters below 3.850 and all the other bands just fine. On the affected frequencies the AT-897 relays do their clicking and eventually stop but the FT-897D continues to transmit. I have to power the FT-897D off and back on to get it back into receive mode. We tried varying the length of coax from G5RV to tuner to no avail.
>
> Any ideas?
>

Thanks to all who replied. You were both on the right track. I posed the problem to LDG and they recommended putting rf chokes on the cables connecting the tuner and radio.

Note that the G5RV has SWR>9 over most of the 80/75 metre band. I don't understand why people say it is a multi band antenna with such a SWR.

Also, the "ground steaks" to which the antenna and rig are attached may be questionable (in our case, non existent).

Cortland,

Thanks for the input. Pretty much everything that LDG makes is rated in PEP. So it's up to the user to de-rate the unit to their particular level of duty cycle usage.

If an LDG balun melted with 100 watts PEP of SSB, I would suspect a bad core in the balun. While we do test every unit, it's not out of the question that it was damaged in shipping or had a defect that only showed up at the maximum stress point.

I know there is no real "standard" for de-rating, but I'll look around and see what is generally used.

This is an exercise that has bit other folks before,Dwayne. A National 500 used sweep tubes with only 60 or so watts of dissipation, and I had one that would regularly melt holes in the PA tube glass. 500/2 for uncompressed SSB = 250, 250/4 for 1/4 of the time spent transmitting gives 63W. EASY to exceed that. And Radio Shack guaranteed their sweep tubes for the life of the product they were used in. Heh.

If SSB PEP is 200 watts, or 100 W average, and if only half the time is spent talking (another /2 = 50W), one might think he only needs to build for 50 watts on average. But for CW, the duty cycle is actually higher than SSB while transmitting, and more if most of the time is spent sending CQ running a frequency during a contest. And that assumes the load is perfectly matched AFTER the Balun.

It looks like these Baluns are meant to follow an LDG tuner (makes sense to me anyway) so for *those* cases, you need to size the core and windings for perhaps 75 percent of PEP and add more for increased current and voltage due to SWR. That last, I think, is why this one got hot.

Cortland,

I am not sure what type of core is used by Dwayne, but if he used two stacked cores instead of one it would double the power dissipation and probably fix the problem. However, more than likely, the number of turns would have to change.

Exactly correct Cortland,

That's why we built our tuners for about 100 watts PEP and our baluns for 200 watts PEP.

5470. Antenna addition

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-07-03 23:35:51 UTC
From: tkift
Topic: 5470 Message: 5470

I currently have a Yaesu FT-840 using an LDG AT-100Pro autotuner running up to a Alpha-Delta DX-EE antenna. I've no problems with the set up until now.

I had to cut down a tree that was supporting one end of the antenna and moved that end to my chimney. As a result I added another 50' of RG 8X to reach the antenna in it's new set up. Now I can't get the antenna tuned up properly. Did I mess up the whole system by adding the extra 50' of antenna? I've tried to reset the AT-100 but nothing is working.

Any ideas?

Thanks,
Terry

Terry==
Two things come to mind; The added cable has a bad connection (short or open), or, the added length presents a tune problem.
The first possibility can be tested with an Ohmmeter, or by substituting another cable.
The second can be tested by adding some length of cable, to "detune". Note--this is a test, not necessarily a fix.
Good luck--Bill--W4BSG

Hi,

I have a Z11Pro2 and I have a FT-857d, both are remote mounted in my trunk. My antenna is a HAM Stick whip. I'll spear you all the gory details of my set up, as its complicated (See "The TMI" at the bottom of this post).

With the tuner (transmatch) physically removed from the system, the only SWR change I see, while driving around, is do to tree contact, and nearby wires (phone/cable) near the antenna, these are extremity momentary. There appears to be no loose connections (the SWR is stable, other than the aforementioned)....

1. The tuner keeps jumping from by-passed to tune, making it imposable to tune the actual antenna its self.
2. As I drive around, while talking, the tuner will suddenly tune, with no apparent change to SWR exceeding 3.0, causing it to tune.

My solution:
I added a remote power switch to the tuner. The 12V is off, except when I need to tune, the tuner (transmatch).

My question:
Anyone else, have this problem of needing to kill the 12V DC power to the tuner (I mentioned this problem to a friend who has a Z11pro, who said he pulls the DC, from the back of his tuner?

AC6DN

The TMI:
The mess, to avoid antenna switches and excessive complications, in my car is:
A Comet CF-706, is used on the radio-side, and a CF-360 is used to connect the HF antenna, and a SBB15 (6m, 2m, and 70cm) antenna. The common jacks to the diplexers are connected together.
The HF-only port out the CF-360 connects to the Z11Pro2. Each antenna coax has a MFJ-270 EMP/lightning protector (gas discharge tube, rated for 400WPEP) prior to going to the diplexers, or in the case of HF, to the tuner.

I saw that where it turned out the hamstick was going bad. I've also seen it with loose connections. Normally I don't see it with the Z11Pro or AT100Pro mobile installs I have. Check all your connections to make sure they are tight.

I'll recheck. With the tuner powered off, or if its not installed, I dont see and big jumps other than the ones described previously.

The weird part is the tuner switching from by-passed to enabled, I find weird. EMI/RFI? I have a farrite on every lead with more than two turns though them.

Pull the hamstick off of the mount and check for any signs of corrosion. Clean both the mount and antenna threads and apply some silicone dielectric grease and reassemble assuring everything is tight. Then check the coax for shorts or loose connections. This may or may not solve your problem. This should be done periodically anyways.

When working with another station on field days/fun days etc. they used to initiate my Z11 tuning because of the close vicinity of the antennas. So I put a in-line switch on the power cable to take it off power when I was tuned up.

I recently invested in a AT-600Pro tuner and overall I'm pretty happy with the tuner. I do have a question about its use when tuning... I find that I can usually tune to a lower SWR manually after the tuner has found a match but why doesn't the tuner find this lower SWR setting when it's going through the tuning phase??

What do you have your threshold at?
The lower you set it the lower SWR it will match to but takes longer.

With the tuner removed, no SWR spikes.

I use oz-gard, This is a new install.
http://www.olypen.com/craigh/oxgard.htm
It cheap and available at ANY hardware store. Dont use it ACROSS connections, as it got conductive particles in it...

BTW: The trunk lid has its own 1-inch jacked Brade.

Depends on the car. My Ford Taures' (light blue) truck got extremely hot when it was hot out side. My Honda Accord (dark blue), is cooler than inside the car (both when they were parked in the sun).

New cars have electronics in the car seat area. I had my radios installed under the seat for a while, with no problems, but I have stock in farrite companies ;-)

5490. New to the group and confused (AT-200 Pro II and AT-200-PC)

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-07-09 20:18:29 UTC
From: Bob
Topic: 5490 Message: 5490

For the past several months I've been busy moving and upgrading my ham shack. As part of that process I bought a refurbished AT-200-PC primarily for use with HF MARS, especially ALE. I plan to use the AT-200 Pro II with an older TS-830S. I am just about finished moving the ham shack and I've stated getting everything back in operation. My primary rig is an Icom IC-756 Pro III and my antenna is an 80m dipole cut for the lower end of the band, and that is what I am using to test and learn about the AT-200 Pro II.

For years my setup was an HF rig, a home brew Ultimate Transmatch (QST July 1970), and my trusty 80m dipole feed with a home brew open wire, balanced feed line. With that setup there was not any where in the ham bands or on the MARS frequencies that I could not get an 1:1 match. Concurrent with the move, I decided to add a couple of HF antennas, a terminated fan and a HyGain AV-640 vertical. That mean that the trusty old balanced feed line had to go so that I could do some coax switching between antennas. Enter the confusion.

First the symptoms:

1. The transmatch will still tune a coat hanger if so desired.

2. The internal tuner in the radio will tune all of 40m to a perfect match.

3. The AT-200 Pro II will not tune any portion of 40m.

Since both the rig has an internal tuner, the process I have used with the LDG is:

1. Zero the 756's internal tuner by tuning it into a 50Î© dummy load.
2. Turn off the 756s internal tuner and leave it off.

3. Turn on the LDG 200 Pro II.

4. Initiate tuning process. with the LDG.

The LDG does not ever bring the load into resonance . . . not even close. Most of the time it goes into a continuous, relay chattering tuning cycle. I'm going to keep at it, but so far it's frustrating as hell as well as very disappointing.

73s es gud DX de Bob NT0A

Topic: 5490 Message: 5491

Good afternoon, Bob.

I can't help you with your question, it certainly seems to me like it should work, but I wanted to comment on your plan to use the AT-200-PC with ALE.

I asked LDG about ALE a while ago (a year or two, I think) and the response I got back then was that ALE operation wasn't recommended with autotuners that use mechanical relays, at least not in modes that require continuous retuning (e.g. scanning and sounding). The advice from LDG at the time was that the relays would be unlikely to last more than a year or so under that kind of operation.

It would probably be a good idea to check in with them before you implement any kind of ALE service with the AT-200-PC.

Rick,

That is true with all LDG tuners except the AT-200PC. The AT-200PC was specifically designed to work with ALE.

Hi Rick,

In addition to Dwayne's comments, let me add that
the AT-200PC under PC-ALE or MARS-ALE make use of
the AT-200PC in a manor where the ATU is in
BYPASS during scanning and tuned from memory but
sending the ATU the next TX frequency prior to
any application of RF and where re-tuning by
application of RF can be had should the antenna
system characteristics have changed since last stored memory parameters.

In addition, MARS members, using MARS-ALE can use
any of the LDG PRO models are supported for ALE
use via their Remote Port for BYPASS during
scanning and re-entry to tuning with the
application of RF. A specific RS-232 signal line
and simple interface is used for ATU bypass and
ATU RF tuning signal can be setup prior to ALE
data being sent. At some point, time permitting,
more of the ATU support found in MARS-ALE may migrate to PC-ALE.

Thanks, Dwayne, that's good to know. I wanted some kind of autotuner to use with ALE and didn't know that the AT-200PC was designed for that. I think that back when you and I had this conversation, the AT-200PC might not have been out yet.

Good evening, Steve.

I suppose that could work somewhat, but one of the objectives of ALE is to find the best frequency to use at a given time, not just to find one frequency that will work. If your antenna is seriously mismatched to your receiver, the perceived signal strength will be much less even for a frequency that would otherwise be optimum, unless the entenna just happens to be tuned for that frequency. So I don't see how you can use ALE to its full advantage unless your antenna can track your receiver as well as your transmitter.

Hi Rick,

It's all relative, so unless you have an antenna that is not providing a relative signal on RX across the board, it works as it should. Most ALE stations make use of "so called" broadband antenna systems, where the random wire is often used, some designs are poor on RX but pretty equal across the board, no dead spot anywhere on RX as there would be with a loaded antenna way off resonance. The use of multi-band resonant antenna systems work fine as long as their use is on band where they are resonant and the harmonics.

Right, that's my point. An antenna that is resonant for one point in the band (and even a random wire is "resonant" somewhere) will not provide a relative signal all across the band, meaning that a given signal strength at the resonant point will result in a higher "S" meter reading than the same signal strength at an off-resonant point. This also assumes that at resonance the antenna is a reasonable impedance match.

Currently I use a tilted-terminated-folded-dipole (T2FD), the B&W type (though it is not a B&W), otherwise known as a "radiating dummy load", for ALE on the Civil Air Patrol HF nets using a Micom radio. I wouldn't be using it at all if it wasn't given to me (actually "loaned" to me) by CAP... certainly I wouldn't have spent $300 of my own money on anything like that. It works about as well as can be expected from something so inefficient, and does provide a reasonable match across the band. Actually, though, it suffers somewhat from the same kind of problem as a non-resonant antenna or random wire... its inefficiency (or "loss" vs gain) varies widely across the band and so it also doesn't really provide a relative signal across all the band, although it is probably closer than a resonant antenna or random wire.

Like I said, it's good to know the AT-200PC is designed for ALE. I'll try that and see how it works.

>
> Rick WA1RKT

I'll second what Steve said about the broadband antenna. I am in the
process of constructing a terminated fan antenna which is very
broadbanded from 1.8 to 30 MHz. It's a bit of a beast that covers 0.4 of
an acre without the support ropes, 1.21 acres with the support ropes,
and has 987 feet of wire and six 600Î© 200W, wire wound, non
inductive resistors. As you can see, all of that results in an antenna
with a SWR curve is very flat
70 foot height
UXO terminated fan
Radiation
Frequency dB Gain Angle SWR
2.00 0.36 90 1.40
2.20 1.22 90 1.27
2.50 2.21 90 1.22
2.67 2.63 90 1.23
3.00 3.22 90 1.27
3.50 3.70 75 1.28
4.00 3.99 58 1.24
4.50 4.24 50 1.15
5.00 4.38 44 1.03
5.50 4.34 39 1.12
6.00 4.20 34 1.31
6.20 4.14 33 1.39
6.50 4.08 31 1.53
7.00 4.69 29 1.78
7.30 5.10 28 1.95
7.50 5.30 28 2.08
8.00 5.76 24 2.59
8.20 6.18 23 2.75
8.50 5.45 25 2.22
9.00 5.57 23 1.60

9.50 3.49 22 1.40
10.00 3.94 19 1.38
15.00 6.32 13 1.06
Hopefully, I will have the antenna in the air this weekend, and, if I can find and fix the problem with the LDG tuners, I will be working ALE next week. Your concern about the mechanical relays would be valid without a broadband antenna. I would love to see LDG or someone else design and build an external tuner for ALE that did not use mechanical relays and could keep up with switching rate of 10 to 20 times a second.

For now that is just a pipe dream because it is such a limited market. So limited in fact that LDG no longer makes or markets the AT-200-PC. However, when the tri-service MARS organization finally dictates that ALE will be the primary mode, the market should entice LDG or a competitor to produce a robust, non mechanical tuner.

I didn't realize the AT-200PC had been discontinued <grumble> <moan> <#$@^%>. Guess I'll have to try to find one on ebay unless LDG has a few leftovers (Dwayne?).

MARS + CAP together aren't likely to represent enough of a market to provide an adequate incentive, especially since those services (CAP definitely, and MARS too even if it's not yet being universally enforced) are required to use NTIA-compliant radios of which there are few if any in the amateur service. CAP has a more or less "official" HF ALE package consisting of a Micom radio and Yaesu T2FD (B&W equivalent). For each CAP wing that needs HF capability (which is pretty much all of them), that's what they get. Getting that changed to make the AT-200PC (or equivalent) part of the officially-approved package probably will not happen in most of our lifetimes even if it is shown to be a great idea. Also, last I looked, PC-ALE was specifically disapproved for use on the CAP HF network, which may or may not still be the case (haven't looked in a couple of years or more).

Hi Bob,

We do not have any plans for a relay-less tuner. We did make one some time back. However, the market is not nearly big enough (as you said) and the cost would be "very" prohibitive. Unfortunately, the ALE market was not even large enough to sustain even the AT-200PC.

We finally ran out of the last of the AT-200PC units from www.cheapham.com, so that unit is only available on the used market.

Hi Rick,

As this is an ATU forum a better forum to discuss broader ALE related matters would be
http://groups.yahoo.com/group/MARS_ALE_RADIO_SYSTEMS/ or
http://groups.yahoo.com/group/MARS-ALE/ for those qualified to join.

However, NTIA radio certification does NOT apply to MARS.

The CAP at present is ALE hardware based only and supplying said hardware in limited quantities as I understand it.

The various organizations providing AUX functions such as MARS, CAP, USCGAUX that apply ALE have different rules and functions, however all make use of hardware ALE, but MARS does not provide equipments to its members any more, in the past there was a surplus program, its long gone, as such most MARS members use MARS-ALE for their ALE capability, even most of those with hardware ALE use MARS-ALE as well and in combination.

By the way, LDG should have received an award for designing the AT-200PC, it stands to this day the most feature rich, versatile and least expensive ATU brought to market for remote control applications in a stand alone or OEM configuration in my opinion.

Yeah, them thar pin diodes and related circuits get expensive, especially when the power goes up. I was looking to put a QSK mod into an older tube amplifier, but the price of the components convinced me that I should just wait until after I collect on the lottery.

Hi,

This is a bit of a sad question "sad" as in oh dear I have finally lost it. I like the idea of the rig-specific tuner for the FT-950, but I would like to tune 2 antennas.... can't believe I am asking this.... hem...

If I was to buy 2 YT-450 tuners, and pugged the RS232 lead into the radio and then into the "radio" socket on the tuner, could I then plug the 2nd YF-450 unit into the computer socket of the 1st and into the "radio" port of the 2nd i.e. a daisy chain.

The thinking is that it would pass through the computer port straight into the other tuner?

So:

FT950---YT-450---YT450.

Ideas?

Hi all,
I am thinking of completely remote my station, and I would like to add the ability to somewhat operate the tuner remotely.
I think that antenna switch and manual tuning button is what I need, but I am asking to the list what I might need more.

I have a total of 7 relays, the first operates mains power for both the computer and the radio(killswitch!), the others can be operated by the pc using the serial port and/or by SMS messages.

How could I safely connect the buttons to the relay unit avoiding RFI and such? Would a shielded cable with two wires suffice? The unit is within 1meter maximum from the tuner.

TIA

Giuseppe Marullo
IW2JWW

PS: here comes the unit:

Hi Dwayne,

Thanks very much. I have just ordered 2x YT-450s and an additional power cable. I noticed the tuner does not do fully automatic mode, but
does semi. Does that have to be done via the tune button on the YT-450 or can a carrier activate a memory tune?

Just so I know.

Mike,

For the YT-450, you must press the tune button on the tuner.

Thanks Dwayne, good stuff. Not having all the RF sensing bits in there has an advantage that one won't set the other off I guess. I will do a video and images of the tuner stack when they arrive - there isn't as much on the web as there is of other LDG tuners.

Hi,

Thanks for your reply Jimmy. I had it set at 2.0:1 but I set it to 1.5:1 and tuned up on 21.300. It managed to settle at 1.58:1 but again I was able to manually tune it lower. It seems kinda pointless having this feature as if I set the threshold lower the tuner will occasionally kick off the tuning cycle during a QSO and, as I illustrated above, despite setting the threshold lower I was still able to manually tune lower. I think I may revert to my trusty Palstar manual tuner!

Jimmy,

This is incorrect. The setting for the threshold is only for the starting threshold when in Auto mode. It has nothing to do with the final SWR.

The tuner always looks for the best match when it does a full tune, no matter what the starting threshold is set to.

All newer models have the minimum threshold range selectable between 1.7 and 3.0.

Jimmy, the threshold isn't what the tuner will go down to - it will always try and tune as low as possible, its just the maximum you wish the SWR to be before the tuner initiates an auto tune.

Say you had a really badly resonant antenna and the ATU could only bring the SWR down to 2. If the threshold is set to 1.7, every time you transmit, the tuner will initiate a tune.

To stop this you could bring the threshold up to say, 2.5 then the tuner will sit still when you are transmitting at 2.0 SWR.

I have been conducting a direct email discussion with LDG on the problems with my AT-2 Pro II, and performed some specific test at their request non of which were successful. I was advised that I should return the unit to LDG for testing and warranty repair. I replied that I wanted to do some additional testing to ensure that "stray" RF was not getting into the unit. Here is the last email that I sent to LDG:

>> Thought you would like to know the results of some further testing.
>> The first result is that there is no problem with RFI or a common
>> mode RF problem. Before I tell you the rest of the results I must
>> bow deeply and say, "gomennasai."

>> There's not a damn thing wrong with the AT-200 Pro II other than
>> the fool who bought it from www.CheapHam.com. I did not allow
>> the unit to crank away long enough to match the antenna to the
>> transmitter. As long as I let it "ka-chink, ka chink" long enough,
>> it will tune any HF frequency to my 80m dipole that I desire, even
>> the MARS frequencies that are not even close to a harmonic of 80m.

>> On page 24 the manual states:

>> >> Thus, it may take several seconds before all relay combinations
>> >> are exhausted, in the case of a difficult tune.

>> Several seconds to me is 3 to 4 seconds. I did not anticipate that it
>> might have to "ka-chink, ka chink" for almost as long as it takes me
>> to tune up my home brew Ultimate Transmatch (QST JUL 1970).

5524. LDG 600 pro one month old problem

Yahoo group: LDG-auto-tuners (2010 — 2017)
Date: 2012-07-14 16:44:13 UTC
From: sarmeros
Topic: 5524 Message: 5524

Hello Al, purchased an LDG 600 pro auto tuner less than 30 days ago and had the following problem. My conditions were as follows.
Using the ts 590 connected directly to the tuner with 100 watts and into a 50 ohm dummy load, before connecting to an antenna.
The pwr switch turned on propery and the ant 2 confirmed tuner setup.
I started checking all bands from 1.8 thru 21mhz and the ant tuned properly with the threshold at 2.0.swr.
When I got to 24.9, the bypass lite turned on and and the tuner would no longer respond and locked up.

Removed the dc pwr and reconnected and the bypass lite would not turn of. Pushing the pwr switch of and on I could not hear the relay click on and off and the bypass lite would not go off. Momentarly pushing the tune button would not turn the bypass lite of either.
The unit was sent in for repair to LDG and the tech reported no faults with the unit.

Thank you LDG for the fast turn around, received the unit yesterday and went thru the same testing and when I got to 24.9 it locked up agn just like before. Any help would be appreciated with regard to my problem with this tuner.

Are you reducing power when you change frequencies and retune?

If your radio isn't automatically doing it, like Icom with the
special cable, you're supposed to.

Tnks Dan
Well the tuner is locked up and can't do nothing right now. Nothing works. No matter what I do. Did it when I got it, Is doing it after I got it back fron LDG. Tech says he could not duplicate the problem.

Tnks Dan
Well the tuner is locked up and can't do nothing right now. Nothing works.
No matter what I do. Did it when I got it, Is doing it after I got it back
fron LDG. Tech says he could not duplicate the problem.

and off and the bypass lite would not go off. Momentarly pushing the tune button would not turn the bypass lite of either.

Tnks

Keep in mind that I am going from the TS 590 into the tuner direct into a dummy load...

One might ask the question, why are you trying to tune up a dummy load? If you're trying to "test" the tuner, then this isn't really a very accurate test. The best match to the dummy load is going to be with the tuner switched out. Unless you tell it to do a full tuning cycle it's always going to see a 1:1 match once it enters the bypass mode, and thus stay in bypass mode. It probably hasn't locked up, but has found the best "match", which would be, a dummy load.

Isn't the idea for a tuner to use it on a non-resonant antenna, what are you actually trying to achieve by running this test?

Further to what I've just said, you've said it's locked up and useless, what I would suggest is it's more likely that it's found the perfect match, which logically would be in bypass mode (straight to the dummy load). Have you tried hooking it up to an antenna, applying some RF and seeing if it tries to re-tune?

On Sun, Jul 15, 2012 at 7:58 AM, Joshua Mesilane <josh@zindello.com.au>wrote:

Well then should not the tuner tune the dummy load and not lock up?
Right now the tuner is locked up no matter whether it is on the dummy load or an antenna. Even if u pwr it down then up it still is locked up. Will not do anything, and the bypass lite will not go out.

So you're saying, that even hooked up to the antenna, when presented with a high SWR the tuner is not establishing a tuning cycle?

Few more questions:

Is the antenna hooked up to the ANT1 or the ANT2 port?
Is the ANT2 light on the tuner lit?

Cheers,
Josh
